Dr. Vandana Sehgal
Principal and Dean
Faculty of architecture and Panning, AKTU

"I take great pride in saying that this institute, in recent years, is steadily growing in terms of students strength, faculty strength, Campus learning environment and resources. "

Dear

It's almost 24 years since I joined GCA as a lecturer. The ambiance of this campus, the teacher-student relationship, the commitment to making this college grow, among everyone, made me part of this family. As a teacher, I am grateful to every student that I have taught and in the process have learnt a lot from him/ her. I would always be filled with awe when the design submissions came or the history presentations were displayed. Today, these very students are making a name for themselves all over the globe, contributing and making a difference and in the process, this institute basks in their reflected glory.

As The Principal and Dean of Faculty of Architecture and Planning, erstwhile, Government College of Architecture, I take great pride in saying that this institute, in recent years, is steadily growing in terms of students strength, faculty strength, Campus learning environment and resources. I know you share my pride in what we are doing and where we plan to go.

I want to thank all of you for the amazing support you have always extended to your alma mater.

From the desk Of the President….

Ar. Mohammad Sabahat
President
GCA Alumni Association

“I request you to think of ways you can give back to the College to whatever degree you are comfortable. “

Dear Fellow G. C A. A. Alumni,

It is an honour to serve as President of GCA Alumni Association for the last six years.

The mission and commitment of our GCA Alumni Association remains the same, to keep our alumni connected to our college, and each other, and to support the students who will follow as a future Architect.

One of my first steps as an Alumni President is to upgrade our social networking capabilities to reach out to our memberships via Facebook and social media and to work on pro activity of Alumni members to be engaged in future activities.

The world gets more complicated with every passing day. We get involved with our families and work and suddenly we’ve lost touch with those outside that close circle. The Alumni Association can help you stay connected to those friends and to the vast resources available here, from the faculty that taught and guided you to our libraries, seminars and symposia, web sites, social media.

At the same time, I request you to think of ways you can give back to the College to whatever degree you are comfortable. There are many ways to give back to your college, from career and academic mentoring to volunteering time at on- and off-campus events to simply attending academic and social events. This academic session the silver jubilee batch 1994 pass-out has set a very good precedent to start a lecture series and honorarium for bright students.

I am looking forward to an active participation from the alumni in all the events of the Alumni Association and be connected with the college…….

From the desk Of the General Secretary

Ar. Anupam Mittal
General Secretary
GCA Alumni Association

Since the formation of GCA Alumni Association in the year 2013, we have seen a continuous progress in the college in terms of Infrastructure, increased Intake in B.Arch. course, Introduction of Masters courses, addition of PHD and Faculty, mix of young and experienced. We are growing fast, getting recognised, creating Iconic structures and carrying the name of our Alma Mater well in the field of Architecture. We really don't need to be reminded that the seed was very much planted here at GCA and we own something which must shared with the budding Architects of our own college in some form. In continuity of this though, the Batch of 1989-94, which is celebrating its Silver Jubilee this year and participating in this year's Alumni meet/ GBM very enthusiastically.

We, the Alumni Association is proud to share that the Silver Jubilee batch has taken a wonderful initiative of starting "ALUMNI LECTURE SERIES", in association with the GCA Alumni Association and conducted by "Faculty Of Architecture And Planning, Dr APJ Abdul Kalam Technical University". There were total five lectures delivered during the Academic Session 2019-2020 on various subjects an the same was attended by many students of various batches mostly from first year to third year.
Ar. Dipankar Mazumdar, B.Arch. 1994, Masters in EP from SPA, winner of Emerson and HUDCO award talked about "Pre-stressed Precast Concrete in Large span Structures" on 28th September 2019. Ar. Peeyush Srivastava, B.Arch. 1994, Author of best-selling book "Maid to Order" and a Reiki channel has talked about "Humanization in Architecture" on 5th October, 2019.

Ar. Mukul Goyal, B.Arch 1994, specialised in Landscape design, winner of Abhivyakti award, also awarded by Bulder's associations Rajredco and Credai. He has delivered a lecture of "Conceptualising Landscape Architecture" on the 19th of October, 2019. Ar. Anupam Mittal, B.Arch. 1994, specialised in concrete structures and Green buildings, winner of CII Industrial Innovation Award, Building for Billion award, IGBC Green building award, HUDCO award has shared his experiences during the 25 years of Architectural Design Practice along with a case study of an award winning Green building project. The last lecture of the series on "Sustainable Practises for Large Format Retail Development" was delivered by Ar. Chetna Pant, B.Arch. 1994, an eminent speaker at Jaipur Architecture Festival, Dupoint Growth Summit and Konnection series, Vietnam.

During the year 2018-2019, GCA Alumni Association remained active in all the important activities in the college such as Independence day etc. The Executive body many times specially for the preparation of this General Body Meet and the Silver Jubilee Celebration for the batch of 1989-94.

Looking for a greater participation and wishing our budding Architects a great future.

Awards won by Alumni

GCA Alumni/2007 Batch
ARCHITECT KULVEER SINGH BHATI won India's Best Spatial Design Studio , awarded by Pool Show 2019.

He is Young, Energetic and Passionate about designing solutions are can be deemed out of the box in terms of material and scale. He founded TOD in 2014 along with Ritu Yadav. His vision has guided TOD through these years and established it as a renowned name in the industry. Kulveer is the brawn that is the driving force behind all client interactions and heads the design team back in the office, he also oversees the execution and detailing of design elements of all projects.

He was facilitated as the winner of Design Quest 2011 by Home Review

.

FOOD PROCESSING FACTORY AT KAHARANI INDUSTRIAL AREA, RAJASTHAN, INDIA

Ar. Dipankar Mazumdar

GCA Alumni/1994 Batch
ARCHITECT DIPANKAR MAZUMDAR, Partner at ENAR Consultants – India has completed his Post-Graduate from SPA, New Delhi in 1996 in Environmental planning,. Experience d in large-scale Industrial and Institutional projects. Awards: Emerson award and HUDCO Award.

ABOUT THE PROJECT

Name of the architectural firm and Design Team, location:
Principal architects: Amit Khullar, Dipankar Mazumdar.
Architects and Interior designers firm: ENAR Consultants, New Delhi, India
Client: Dr. Oetker India Pvt. Ltd.
Built-up area: 2.10 Lakh SQ.FT approx
Cost of project: 32,096,748.00 $
Year of completion: 2016

OVERVIEW

The Oetker Group is one of Germany's largest food sector industrial group. Over the years, the company has grown in the food industry sector with their frozen foods, chilled desserts and ready-to-eat mixes, through acquisitions within and outside Germany. In 2007, the Oetker group ventured in the Indian market and Dr. Oetker India Pvt. Ltd. was established. In 2008 Dr.Oetker India acquired Fun Foods in India. Their first industrial setup has been recently completed in Kaharani Industrial area in Rajasthan.

The site for the industrial Building for Dr. Oetker India Pvt. Ltd. is located at plot no. SP-3&4, industrial area Kaharani in Bhiwadi (EXT) of District Alwar, Rajasthan. Spread over approximately 210,000 sqfts on a 15 Acre site. The building has been planned on a 10mts x 15mts grid.

The language for notable contemporary industrial projects in India has been defined by structural innovations. Continuing this philosophy, this industrial project utilizes pre-tensioned precast technology to create a large span structure with impeccable finishes to conform to the highest European standards.

SITE DESCRIPTION

Before the commencement of construction, there is one important factor which affects the whole process i.e. *the Site Topography*. In this project that was the first constraint. As the site is located in Rajasthan, which is a desert, so it is mainly sandy and dry.
Site was a typical deserted land with heighted sand dunes all over. It was a difficult chore to level the site and relocate that sand which was dug.

Below are the images of site at initial stage:

IMAGE 1: VIEW OF SITE FROM THE CROSS-JUNCTION

IMAGE 2: SITE VIEW FROM THE SOUTH-WEST CORNER OF 60M WIDE ROAD (TAPUKRA- KAHARANI ROAD)

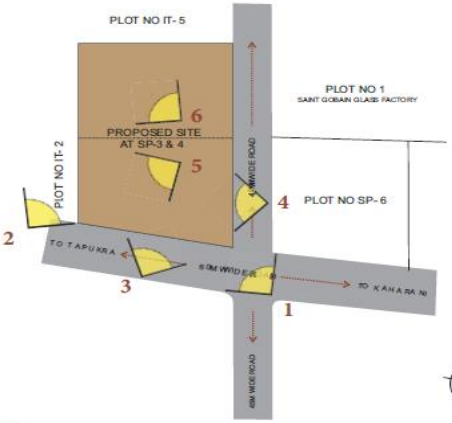

IMAGE 4: VIEW PF SITE FROM THE MAIN ACCESS ROAD - 45M WIDE ROAD

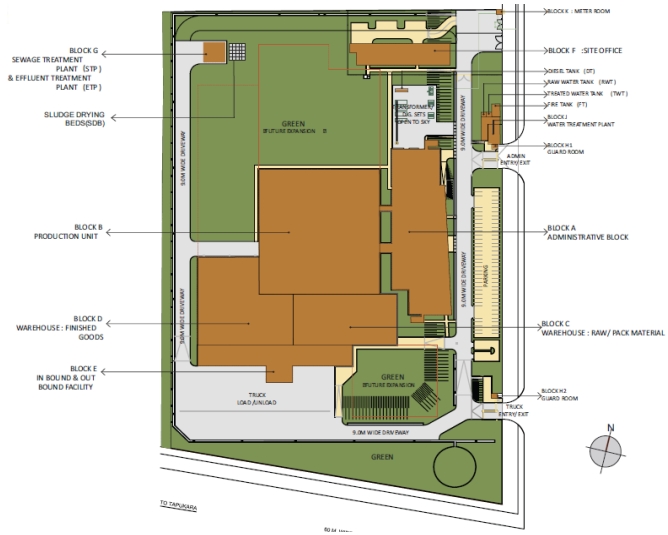
IMAGE 5 : VIEW OF HILLS AT THE WEST SIDE OF THE SITE

IMAGE 3: VIEW ACROSS THE SITE. SAINT GOBAIN FACTORY ACROSS THE 45M WIDE ROAD

IMAGE 6: VIEW OF WEST SIDE OF THE SITE FROM THE CENTER OF THE SITE

SITE LEVELING



BUILT FORM AND SITE DEVELOPMENT

PRECAST TECHNOLOGY

Precast technology is not really a new way of making buildings, the origins of precast pre-stressed construction are more than 70 years old and was popularized post the Second World War to help rapidly rebuild Europe. In India this technology is popularly used to make bridges and also some individual components of composite buildings. Recently this has been used to make mass housing specially EWS and LIG housing.

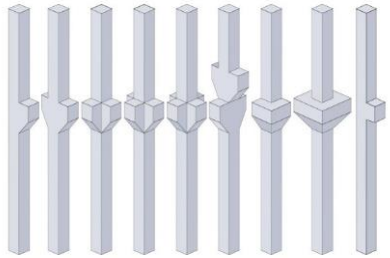
Precast concrete technology has its unique advantages over regular cast in situ concrete construction. It provides:

- 30% quicker to execute when compared to traditional cast in situ construction.
- Minimum disruption due to off-site fabrication of construction elements such as BEAMS, COLUMN, SLABS and WALL elements.
- Manufactured with automated machines hence the quality of concrete work and finishing is immaculate.
- Easy and quick erection with minimum manpower and mechanized equipment.
- Minimum noise and dust pollution due to construction.
- Environmental friendly construction methodology.

The structural elements such as the columns, beams and slabs were manufactured at the production facility at Manesar, Haryana and then transported to site for erection. The quality of manufacturing ensures that the precision of the elements are extremely high resulting in a superb interior finishes. This technology also ensures that the time taken for erection is much less than conventional systems and uses substantially less manpower. This technology has a high relevance for building with replicated modules such as schools and colleges and we are presently designing several proposals for educational buildings based on this technology.

ENERGY CONSERVATION

Energy saving was an important aspect of the design



process. The annual variation of temperature in the project site of up to 42 degree Celsius resulted in implementation of a high degree of insulation in wall and roofs of the project. This has resulted in substantial reduction of heat gain which in turn has resulted in savings in energy costs. The work areas are all extensively day lit, completely eliminating the need for artificial lighting during the daytime. All fenestration are equipped with high performance DGU units to cut out heat gain. The production areas are day lit by linear skylights eliminating the requirement for artificial illumination during a majority of the production hours.

On the technological side, the Air conditioning system uses air instead of water for cooling as the site is in a critically over-exploited zone as per classification of CGWA and use of minimum water is an important part of the design brief. Heat recovery cycles have been implemented at every fresh air intake to optimize energy consumption. Even utilities like the Boilers have air pre-heaters implemented to withdraw maximum heat from the flue gases to heat up incoming air and create substantial energy saving. Superheated condensate is also utilized in the hot water generator to extract the heat energy from what can be a waste product.

The electrical system is made efficient by implementing Variable frequency drives at every power consuming equipment such as pumps, Motors and Compressors to optimize energy saving. All illumination in the project is by LED type lighting fixtures. This coupled by the extensive day lighting in the building results in a huge saving in the energy bill. Solar energy has also been harnessed to ensure that.

WATER BALANCE - ZERO DISCHARGE

Saving water was one of the most important design parameter as the site was in a critically over-exploited zone as per classification of CGWA. As per the same whatever was extracted, the double of the same had to be harvested back. Dr Oetker took to creating rainwater harvesting structures in the villages in the surrounding areas as a part of its corporate social responsibility to give back to the immediate environment twice of what was extracted. As a result, groundwater levels in the surrounding villages has increased thereby improving the quality of life of the local residents in this arid region of the country.

Rainwater falling within the site was also harvested by very innovative modular cellular structure made out of wastes and recycled plastics. This ensured that concrete drains, soak pits etc were completely eliminated and a simple quick and economical solution was implemented. The roofs have been laid on a slope to ensure that there are no rainwater pipes in the production facility, rather edge gutters drained by state of the art symphonic drainage systems have been implemented for rainwater drainage.

Also frugal water consuming units such as high efficiency fixtures were implemented, 100% water is being recycled, treated water is being used for flushing and gardening, creating a ZERO Discharge water balance ensured that a fraction of the total water that could have been required was actually consumed. One of the biggest challenges to achieve this was recycling the RO and the WTP backwash wastes. Since the processed food industry extensively uses high quality water treated through a reverse osmosis process, it also generates a large amount of process waste. This high salt laden water in unfit to be treated by any conventional means. To achieve this a Vacuum distillation device has been installed to recover about 16000 liters of water daily which would otherwise have gone to waste.

MATERIALS

The facades are made in PVDF Aluminum cladded Kalzip panels to create a maintenance free facade. The front elevation

however is a fusion of modernity and tradition created in locally available shot blasted sandstone and Aluminum composite panels to reflect to the architectural language of the region of Rajasthan and the European stylization respectively.

Interior material used in flooring are vitrified tiles and industrial tiles so that it can withstand heavy load movement of goods, machineries, forklifts and vehicles.

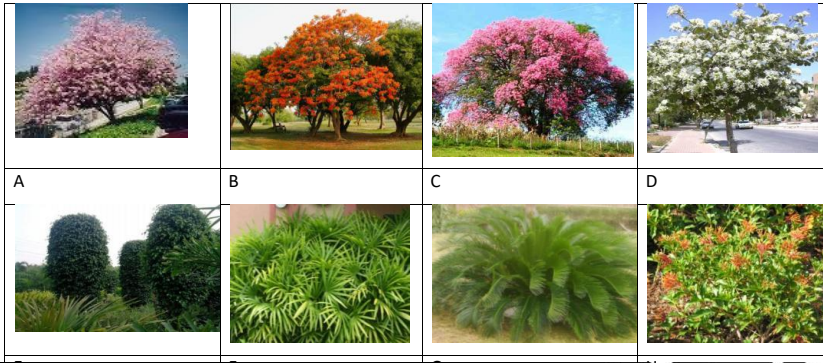
On walls, ceramic wall tiles, white board, glass and plaster of Paris are used for finishes. False ceiling are created with commercial board, Gyp-board and G.I. channels.

LANDSCAPE

As the site is located in Rajasthan and there is less availability of water, so the landscape was done with vegetation which are low maintenance and requires less hydration.

Mostly the site and building periphery was aligned with landscape belts. Building periphery has taller plantation unlike the internal site landscape. Trees such as *Bauhinia variegata(A)*, *Delonix regia(B)*, *Chorisia speciosa(C)* and *Bauhinia alba(D)* are planted. They not just reduces the view of site but adds color to the dull industrial appearance.

Plants such as *Ficus black(E)*, *Raphis palm(F)* , *Cycas revoluta (G)* and *Hamelia Patens(H)* were used in internal landscape areas, which are short heighted.



As in Indian architecture great importance to courtyard is given , so to reflect that internal courtyards were designed between buildings. Not just aesthetical but these courtyards gives an eye pleasing view for the workers and staff.

Also landscape plays an important role in rain water harvesting. Rainwater falling within the site was also harvested by very innovative modular cellular structure made out of wastes and recycled plastics. A simple, quick and economical solution was implemented. Saving water was one of the most important design parameter as the site was in a critically over-exploited zone as per classification of CGWA. As per the same whatever was extracted, the double of the same had to be harvested back.

Dr Oetker took to creating rainwater harvesting structures in the villages in the surrounding areas also. As a result, groundwater levels in the surrounding villages has increased thereby improving the quality of life of the local residents in this arid region of the country.

Conceptualising Landscape Architecture

Ar. Mukul Goyal

GCA Alumni/1994 Batch

Ar. MUKUL GOYAL ,after completing his bachelors in architecture started working in Delhi under famous landscape architect NG SHASTRI. After a long journey of designing various projects in the hospitality, it, residential sectors in Rajasthan, he moved to Delhi in 2018, to establish another office by the name of mg associates. today this office is handling national level projects with its base in Hauzkhas, New Delhi. Abhivyakti Award by the ex-chief Justice of Rajasthan and Appreciation from CM Vasundhara Raje for Genpact project. Awards from Builder Association like Rajredco and Credai.

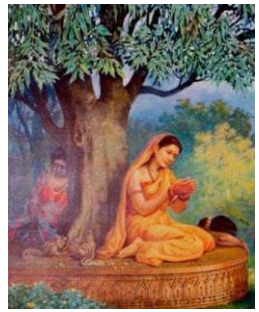
INTRODUCTION

Landscape Architecture is one of the most important topic of Architecture as it not just adds a plate to the building but also makes it more Sustainable and Climate friendly. This subject teaches one how to design and treat the portion of the land between the boundary wall and the building ensuring that the open space becomes a usable/aesthetically pleasing space. The minute design extends beyond the boundary wall, its name changes to Urban Design. But here the discussion is limited to the Landscape Design within the Boundary walls of a plot.

The most pertinent question of how to start a design always arises when one receives a blank piece of paper. To begin conceptualizing the Landscape Design there are certain principles to be considered which nature has already taught us about. And also Indian history has been teaching us again and again about Landscape Architecture which probably went unnoticed.

HISTORICAL REFERENCES TO LANDSCAPE ARCHITECTURE

The most exciting part is the fact that since childhood we have been listening to stories from Mahabharat and Ramayan. And some of the most intriguing episodes have references to the Landscape Design. For example in Ramayan , the Garden in which Sita was kept hostage was called ‘Ashoka Vatika’.



And it was in the branches of the dense Ashoka Tree in which Hanuman hid and dropped Lord Ram’s ring onto Sita’s lap. The story tells us that the beautiful Gold city had an equally beautiful Landscape Garden which was only befitting for a queen like Sita.

In Mahabharat , the Pandavas were granted a barren land by the banks of river Yamuna (now delhi). They built a beautiful city by the name of Indraprastha and it soon became famous all over the land. Equally beautiful were its gardens and when Duryodhan came to know about it , he paid a visit to the city with his brothers. It was while admiring the well manicured gardens of the palace that his foot slipped and he fell into the fountain. At a distance, in the balcony Queen Draupadi on seeing this incident started laughing and commented to her attendants about Duryodhan’s poor eye sight. This infuriated Duryodhan and he vowed to take revenge for this insult. A beautiful garden with an equally beautiful fountain became the catalyst in what is known as the largest war amongst two Royal families.

The point to be noted here is that all this happened almost 4000-5000 years ago. The art of designing cities and landscapes has been mentioned in the Atharva Veda followed by references in the Puranas, and Mansaaras. Unfortunately, most of this knowledge has been lost to repeated plundering of the land by invaders. Still we have references to understand that the genesis of great civilizations was in the Indian sub-continent.

INSPIRATIONS

"Design is nothing but derivatives of what nature has already done……"

Once we understand the above statements we will understand what all great Architects refer to when they present their designs. A whole Concept can be visualized and explained using the Earth as a Pallette of Forms, Colors and Textures. Especially nature in its raw form has so much to teach us. Every view , every season, every landform conveys to us Design elements which can be used to enhance and excite the human mind.

A sudden clearing in the forest would explain the importance of 'Solid and Voids'. The reflection of uneven mountains in a lake would explain the concept of 'Asymmetrical Symmetry'. If you would look up at the dense trees in a jungle, you would see a convergence of 'Radial Formations' in the centre. And in the same way a water fall would give an impression of 'Verticallity'

With so much to learn as we walk around the untouched part of our planet, we get to see more and more concepts which teach us about the play of 'light and shadows' and 'Surface Textures'. The 'dynamism' brought by birds and other small animals in the scenery completes the design ensuring that Landscape is complete without creatures of god.

LANDSCAPE ARCHITECTURE – SCOPE OF WORKS

During conceptualization of Landscape Architecture it is necessary to understand the requirements of the project and bind the design through the various areas to be treated. With broadly Landscape being divided into two main catagories ie Hard Landscape and Soft Landscape, it can further be divided into a Drawing Schedule Basis..

1. Internal Plot Boundary Wall designs
2. Roads & Sidewalks details.

3. Parking design
4. Internal Courtyard design
5. Terrace Garden design
6. Artwork , Fountains , Sculpture, Bridges for the entrance areas.
7. Storm Water drainage plan of site and runoff management (RWH)
8. Irrigation Network
9. General Electrification scheme for External areas.
10. Decorative lighting details of complete external areas
11. Plantation plans of plants
12. List of potted plants
13. External Signage's
14. Earth Mounds
15. Children Play Areas / Sports Grounds

Many more categories can be added depending on the nature of the project.

IMPLEMENTATION PROCESS

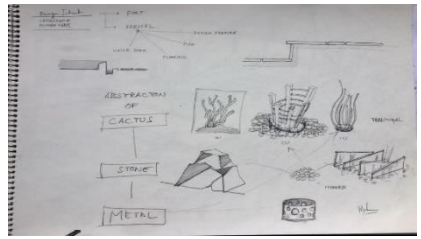
There are two case studies that shall be examined for the purpose of Conceptualising the Landscape design.

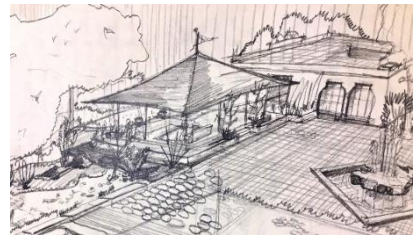
1. Alila Bishangarh Fort , near Jaipur
2. Kiplings Lodge, Ranthambore

The scale of the project was different in both cases, with Alila Bishangarh being more luxurious and demanding

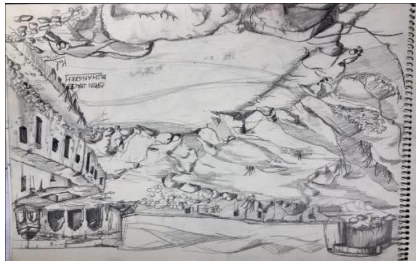
ALILA BISHANGARH FORT

This project consisted of two parts. The first being the internal area of the fort and the rocky hill itself. The second part was the arrival area and banquet lawn with pool at the base of the hill. The main consideration was to retain the rocky flavor of the hill and ensure the rustic nature of the Fort ambiance. Initial sketches were made for approval and then using main elements of fire and water the design was conceived.





So the play with Horticulture had to be minimal and focus was to be on the use of rustic nature of stone on roads , feature walls and the pedestrian walkways



The upper part had just one open space which was developed into the only green space for visual relief. Sketches were made initially to understand the character of the space. Elements of Texture and color become an important design factor.

KIPLINGS LODGE

This was a small 17 room boutique property which had no reference point for design as it was a farmland besides a village. So the property was designed to look within itself i.e. introvert design and Landscape and Lighting become the most important elements here.

The courtyards had to have spaces where the guest could relax after a 3 hour safari using earthy colors of the jungle. Even the stone was used in a way to give a feeling of natural surfaces which would give interesting shadows in the evening.

Overall effect was to depict an old British hunting lodge with some side cottages for the entourage. The central space was designed as an expansive lawn with a small Amphitheatre and swimming pool to compliment it.

CONCLUSION :

Architectural Design does not just mean the building design part but also the base area on which it is made. With the help of nature we can easily visualize as well as conceptualize our Landscape design projects. This can be seen easily in almost all good projects being designed. And to make our buildings more relevant to the surrounding nature , there should be a judicious Landscape Design.

Sustainability hacks: Hierarchical role-play towards devising a Development Model for India

Ar. Peeyush Srivastava

GCA Alumni/1994 Batch

PEEYUSH SRIVASTAVA, Managing Director of NEXUS CONSULTANTS, with over 19 years of qualitative & rich experience as an Architect. Expertise in designing, planning, monitoring, team building, project procurement and execution of projects. Proven abilities in designing buildings, master planning, and client / team management at national and international platform. Author of best-selling book-"Maid to order". Certified Reiki channel, Certified Dale Carnegie trainer, Marshall Art practitioner.

ABSTRACT

The concept of sustainability has been introduced since very long, however, the present urban scenario is an evidence that this concept has been largely restricted to textbooks and the idea of twinning sustainability with development is more of theoretical and conceptual base than being a practical one. Sustainable development has a four-fold definition under the parameters of futurity, environment, participation and equity but the urban mechanism demands a wholly different approach towards sustainability which involves planning, property development, construction, design and operational sectors of urban development process.

Considering the clarity of the basic definition of 'sustainability', which signifies not to create any environmental damage and start with utmost sensitivity right from the first place; the only process to channelize the knowledge in right direction is by removing the barriers of sustainable development. These maybe unsustainable lifestyles and behaviours leading to higher emissions, increasing social and spatial divisions, negligence to citizen's participation (feedback and monitoring) in development pertaining schemes, lack of holistic view in contrast to current reluctant approach of functioning, capacity and capability issues, frictional ideologies of local regional and national bodies, lack of support to research learning and pilot projects, etc. The methodology lies in processing and reviewing the primary information, user perspective and the preconceived notions about sustainability, thus, understanding the, critique, along with suggestions regarding a particular layout for sustainable development.

The need of the day lies in readdressing the way we plan, finance, develop, govern, and manage cities in order to ensure the validity of sustainability so that resources and comforts do not turn out to be mere topics of storytelling in near future. The aim is thus, to identify all the actors of society that can be potential contributors in the transition towards sustainable world along with the universities and organisations, which are seen as major catalyst towards achieving this goal.

'Sustainability is the Nexus of Society, the environment and economy...'

INTRODUCTION :

Any human activity has its own carbon footprint whether it involves fuel burned to produce goods far away from the final consumer or directly burning fuel in one's car or stove. Sustainability has become a strategic imperative for almost all businesses in the early stages of this century and has evolved into a fundamental market force affecting long-term financial viability and success.

"We are such spendthrifts with our lives, the trick of living is to slip on and off the planet with the least fuss you can muster. I'm not running for sainthood. I just happen to think that in life we need to be a little like the farmer, who puts back into the soil what he takes out."
— ***Paul Newman***

Figure 1

Figure 2

Primarily within the three major dimensions of Sustainable Development, that are economic, environmental and social , we utilize the LEED requirements for environmental sustainability evaluation and introduce a series of factors related to social sustainability. In our evaluation of the built environment we introduce an extension to the ecological modernization theory at the organization level which we term **Sustainability Modernization Theory.**

The built environment includes all buildings and living spaces that are created, or modified, by people. In addition to the buildings and spaces themselves, it also includes the infrastructural elements such as waste management, transportation and utility transmission systems put in place to serve this building space. When evaluating the built environment, it is important to take a broad view incorporating broader stakeholders and communities, beyond immediate investors or building users. The intergenerational aspect of sustainability is even more pertinent in the built environment since the structures are typically influencing the needs and requirements of future generations. Sustainable construction is an emerging field of science that aims at incorporating the general sustainable development concepts into conventional construction practices . The triple-bottom line factors associated with the choices made in the design and construction of buildings and outdoor living spaces must also be balanced. In addition to balancing these often conflicting goals locally, the decisions made about the built environment must also consider how choices made about building materials and systems can have environmental and social impacts on broader regional and global dimensions. For example, the entire supply chain for construction should be evaluated - from the selection of sustainable material such as bamboo wood to finding contractor and subcontractor sources with corporate socially responsible practices.

Even though each stage has some sustainability influence usually the early stages of acquisition and design will play the largest role in the life cycle sustainability implications of the property. Similar to product life cycle project planning where a vast majority of the eventual costs of an overall project will be determined at this early design phase, sustainability implications will also be determined at these early phases. **Thus, the major opportunities to design the built environment for sustainability occur at these early phases.**

The need of the hour is to reduce the burning of fossil fuels and eradicate the present conventional style of practice that is based upon construction of the built environment first and then later ***pasting the technology*** to make it appear a sustainable building. The question here arises is to why blindly ignore the environmental aspect and not consider the carbon footprint reduction right from scratch and then move step by step limiting the usage of energy as much possible in spite of later adding more equipments to make it ***appear*** environment friendly by involving more of energy-based equipments that require again emission of carbon .

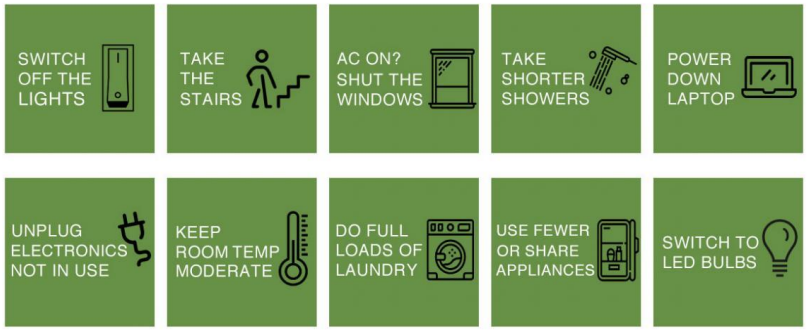


Figure 3

SENSIBLE USE OF TECHNOLOGY*:*

From the viewpoint of society needs, it is necessary to ensure the further development of economy on the one hand, and, on the other hand, to reduce the environment contamination and to ensure the environment protection. ***The artistic creation is the high degree of proficiency***. The complex problems of the human /nature relation are based on certain philosophical foundations in each historical era. The present period can be characterized as the era in which the humans incessantly start turning the higher merry-go-round of substances and energies in order to satisfy their needs, with reality that the ***bulk of these substances is growing much faster than the human needs.*** On one side it displays deficiencies of resources and energy (resource stocks have been stretched) and on the other side it wastes with resources and with energy. Sustainability considers the nature and human from the viewpoint of optimum development of the whole biosphere. The ecological behaviour should not be reduced to the riotous discussions around the nuclear power plants and water structures or industrial complexes. We must plan and build big structures. At the same time, we must consider the impacts of these constructions on the environment and human health.

Every action has an equal and opposite reaction so any electrical usage should be minimized to its optimum level because that can create a huge impact on the cost saving and also at the same time making the environment beautiful place to live in naturally rather than being dependent on human technology. It is rightly said ' ***Careful Pruning***' is the goal for today's sustainable environment.

The much better idea is to harvest from tree and not totally cutting it ,which is somehow lacking in today's scenario.

WHAT CAN BE DONE :

The 3 R's :
Reduce
Reuse
Recycle

are a complete summation of coining a building or the applied materials into it as ***sustainable*** **.**Even though each stage has some sustainability influence usually the early stages of acquisition and design will play the largest role in the life cycle sustainability implications of the property.

Materials and land may be reused or made useful for other purposes at the end of a structure's life and these issues should be considered, even though the life of structure may be managed by future generations and not the one that designed, constructed and occupied the property.

EXAMPLES OF HOW TO ACHIEVE SUSTAINABLE PRACTICES

One of our Township Projects at Jhansi involved the practices that beautifully complimented the built environment and added value to it in terms of landscape and user friendly environment .

1. Vegetative Bioswale:

- Save capital towards building expensive underground storm water drainage system along main streets.
- Moisture loving shrubs and perennials with roots that facilitate faster rain water absorption.
- Unique feature and a precursor of such initiatives by other townships in India.

Figure 4

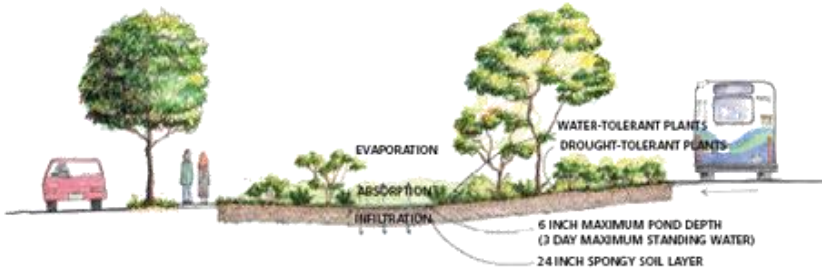

Figure 5

2. Pedestrian trail :

Provision of Linking Paths that connect two zones and make it more convenient for the users to move through the area enjoying the landscape and not feeling bored while walking down the lane to the required zone.

CLIMATE RESPONSIVE ARCHITECTURE :

Climate responsive architecture takes into consideration seasonality, the direction of the sun (sun path and solar position), natural shade provided by the surrounding topography, environmental factors (such as wind, rainfall, humidity) and climate data (temperature, historical weather patterns, etc.) to design comfortable and energy-efficient homes.

Figure 6

Figure 7

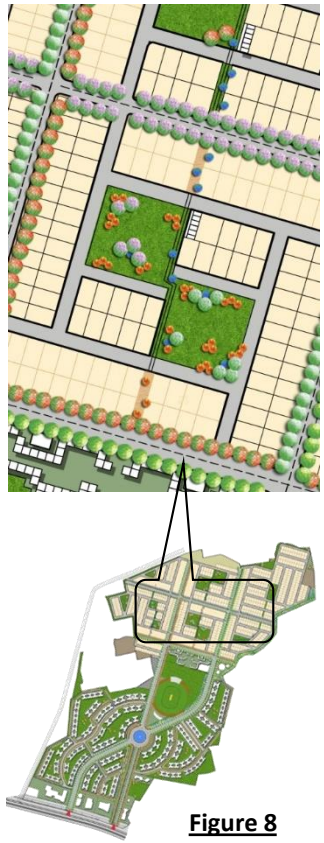

Figure 8

MINIMIZE THE BUILDING FOOTPRINT :

Question the true needs of the program. Do you need that much space? Are there ways that spaces can become multi-functional? Do we need that many private offices if some staff can telecommute occasionally and share offices? Once your team is set on the minimization program, take a look at the size of your footprint. Is it possible to add extra stories to make the footprint smaller?

That way, the building will have fewer excavation costs and more wall area that can benefit from the warming effects of the sun and an increase in natural day lighting.

Thus Sustainability does not mean making only a building a healthy place to live in but also the environment that surrounds it . It considers the human as an element of system and it integrates human activity with environment protection. It sentient reacts to human needs in the system contexts and includes quality environment management. The goal of human society management is to ensure the protection of: human lives, health and security; property, welfare; environment; infrastructures and technologies, which are inevitable for human survival, i.e. the mobilisation and co-ordination of utilization of national sources (energy, labour force, production capability, food and agriculture, resources, telecommunications etc.), the co-ordination of such activities as they are notification system, rescue system and medical services that reduce impacts of natural or other disasters and ensures the continuity of activity of public administration, the adherence of legislation and also generate the conditions for start of development.

The environment is an adaptable system. During their development, the humans have accumulated much knowledge and experience, and therefore, they are supposed to know the ways to limit the interventions to a system, so that to ensure the system development in the direction supporting the mankind's development.

The Journey of Twenty Five Years

Ar. Anupam Mittal

GCA Alumni/1994 Batch

ARCHITECT ANUPAM MITTAL within a year of passing out, started his design firm, in the name of Architects Plus. He is now the Principal Architect & Director of Arinem Consultancy Services Pvt. Ltd. and Co Chair IGBC (UP Chapter). Since academic days, he had special interest in concrete.. He also coined the name RMDC (Rapid Monolithic Disaster proof Construction) for monolithic concrete construction, a technology he has passionately followed, researched and used in most of his work. He also assisted on a book of Box Culvert Design. He has received many awards like HUDCO Green Building Award 2015, ICI (Indian Concrete Institute) Concrete Building Awards in 2015, 2016 & 2017, CII awards and many others for his works.

Mail : anupam@arinem.com, ar.anupammittal@gmail.com

INTRODUCTION

Myself, Anupam Mittal, an Architect by profession for 25 years, having my own practice since 1995. In the 25 years of Architectural Design practice, which was started from scratch, I kept experimenting with the materials and technologies in the large field of construction. Since I could not get much form the existing research and development in our developing India, I had to accept the challenge and moved forward to put the ideas on the practical field for larger acceptance. Other than Architecture, Sports remained my passion and I could still pursue games and sports as and well I am able to. In Golf, I won many tournaments and got published prominently in national magazines. In IIAPL, the annual national sports meet by IIA, I found myself within top four ranking in India currently. Writing and film making (short films) remained as my hobby and my YouTube channel Shots Creations could beg attraction of over 8 million views and over 11500 subscribers to keep encouraging me for further contribution in the field.

THE GREEN CONNECTION

Relationship with IGBC was never in my thoughts but it just happened when my approach towards the design and construction got noticed through my papers, media interviews, seminars and awards and received an invitation to contribute by taking a big responsibility by accepting the post of Co-Chair IGBC, Uttar Pradesh chapter. Before convincing people to adopt Green rating for their projects, I took my own house as a subject and made it IGBC Platinum rated house which also won “Green building project” by HUDCO. Uttar Pradesh being large and populated, opportunities found endless and my responsibility too becomes larger and much bigger than ever thought but I am very sure that the my largest family of IGBC, through its mentors will guide me to achieve the goals and reach the peaks of the Green Revolution. My immediate focus is to create maximum students chapters in the state of Uttar Pradesh.

ESTABLISHMENT

ARINEM Consultancy Services has three major offices, New Delhi, Pune and Lucknow as the head office. With over 175 staff strength, mostly technical, ARINEM stands ahead in many verticals of the Architectural design sector, the most important remains concrete structures which also contribute to the green building revolution. Use of latest technologies in construction, experimenting attitude in designs, creative conceptualization and philosophical approach bring ARINEM amongst the very few design companies in India whom the trust of Private, corporate and Government sectors are equally established till now.

Being the Principal Architect and Director, my role does not restrict to few areas of the organization but designate to be the final authority for the major concerns of all the verticals

Depends how you conceptualize and implement. When one decision adds to the cost, the other decision can immediately save the cost or even saves above it. For example, costly STP treats the grey water but the proper use of treated water not only saves the pumping of fresh water but provide you extra water for use to other project sites and adds to the income. Today if the cost effective technologies, latest materials and expert advice have been taken well in time, the cost verses receiving will not create any buzz while we wish to take any project to achieve the best of the green ratings from IGBC or any other rating systems. Fundamentally, we need not to follow but to lead in aspiring green rating by experimenting things creatively.

THE GREEN INITIATIVE

Various state Governments have announced many incentives, mostly in the form of additional Floor Area Ratio (FAR), as an initiative this much got well accepted by the industry in general but IGBC being the part of CII may be able to workout better or more lucrative formula for the State Governments. I am sure that we can propose some practical formula after taking CREDAI and other such active organisations which can be acceptable by most of the stake holders in large. Affordable housing and Infrastructure are the fields of today and tomorrow, Government has funds, good intentions and running schemes, IGBC team may study the same, club them together in line with the offered incentives and suggest the government more options for the direct benefits to the developers. The incentives may be both direct and indirect, in financial terms and in the form of additional area, developer must see some immediate benefits for sure, long term benefits may follow as the project moves ahead.

ADOPTING TECHNOLOGY AND RESULTS

We see more emphasis on the green materials and that adds to the cost rather we need to give weightage to the design which has been developed in view of making the building sustainable. Proper ventilation and natural design with controlled sun will be the first move, selection of materials will add to the points to certify the building green rated.

Saving in the bills of water and electricity may be treated as the immediate advantage. How the built environment gets energized by natural ways of making the building green and start giving you advantages may not be even noticed unless you know the long term health hazards of artificially created comfort zone. Natural ways of making building green is more of a creative attempt, using technologies and economical ways of adding points to make it greener are very practical and acceptable. Many buildings have been done using natural ways or converting it green due to the limitations of use, orientation or the micro climate. It's is not something which has drawn out of a book but a process, initiated long back and we as IGBC members are trying to consolidate the success stories. So there will be a cost to it, yes, there is a cost of your good health and we can't afford to compromise on it. If you do not Invest on the advice, you will end up spending artificially preparing your built environment suitable to your needs, not helping you and neither healthy at all.

Whatever we adopt becomes conventional and the technology will keep raising our expectations to get something bigger, faster, smoother and cheaper but this is just a process, we need to understand our needs and limitations before we actually adopt conventional or non conventional technology for the construction. I will prefer discussing technology in two aspects of green buildings, construction technology and technologically advanced systems for making a building green. Construction technology effects the projects in a very large manner, it transforms the thought process of the developer and the team from the very beginning and opens all the fronts for better understanding of the green aspects. It becomes easier to adopt the green concepts once the alternate technology has been used for the construction.

Technologies are advanced and adoptable, most of them are available in developing countries but it is advisable to select an appropriate technology which is conducive to the local climate, soil conditions, use of building and the longevity expected.

MY ROLE AS IGBC CO -CHAIR UP

I am the Co-Chair of IGBC UP Chapter and keep pushing the concept of Green Building at all the forums whenever I get a chance. As an Architectural design company, we do have IGBC accredit professionals in house and we also hire independent consultants for our projects as and when needed. Yes, we have finished few projects and the best example remains my own house which begged the "Platinum" IGBC Green Homes rating and also got awarded "HUDCO Design Award" for the year 2015. Since it is an independent house and we ourselves are the architects, we worked on the orientation of openings which resulted the house to be a well sun controlled house. Most of the inclined shading devices are made of Solar panels and connected on grid, roof top gardening and terrace garden keeping the roof cool, energy efficient VRV air conditioning consuming less energy, water saving devices, 100% LEDs for lighting, 2400 litre capacity STP with dual plumbing for reuse of water, central solar hot water system, used fly ash ASC blocks for walls and recyclable metal windows. The electricity bills are showing all the difference, nothing else is required to be proven because we are able to save the electricity usage due to various actions as mentioned earlier.

Since the year 2015 we have been using the entire system and we do not face any unusual problem, but one thing is for sure that one need to maintain the system and ensure that everything runs well. We are happy and it has been noticed that all such habitants of green building express their happiness while discussing green buildings. Whenever the user shares the green aspects, they feel proud to be the one of those who are not only saving their money, but their small effort is contributing into the Mission Green.

The power of green initiatives by IGBC could influence the Governments, both state and Centre and it happened in the recent years when the incentives and grants were offered by various departments such as Department of Renewable energy, Department of Housing and Urban Development etc. The inclusiveness of authority has helped in gaining the confidence of stake holder in a large way and its very important for IGBC to take larger Ministries into confidence for adaptation of Green Concepts through their policies. I will like to take IGBC closer to the Government bodies after understanding their views and schemes under consideration, the same may give IGBC some lead to introspect the pattern we have have adopted so far and actions needed.

Since my work area is primarily Uttar Pradesh, additional 5% FAR for the green buildings may be treated as the biggest achievement at the policy level but getting PMAY projects registered for the green certification gives me greater satisfaction.

Public & private participation is also very essential for the successful implementation of Green Building Concepts so what are the initiatives taken by IGBC to attract public and private enterprises in using Green Building Concepts.

While concluding my views regarding the subject so far, I also feel that unless "Getting Green" becomes a house hold slogan and the kids of every family start throwing set of questions to the seniors of the family about the energy conservation, recycling, reuse and the health hazards caused by the artificial lifestyle, we at IGBC must keep our seats belts fasten for the journey has just started. Initiatives have been taken but nothing is enough as the population verses growth verses energy demand verses green footprint will remain a struggle for a long time. Let us discuss more, share much and act faster to take a lead to make India, best place on the planet to live.

Cohesive public awakening & introspection besides Professional navigation in undermining the negative environmental impact

Ar. K.Sridhar

GCA Alumni/1988 Batch
M.Arch. (Landscape Arch.), MDU (Gold Medallist)
High energy professional with experience in Architecture, design targeting, landscaping & organizational capacity seeking challenging assignments in the coveted domains. Over thirty one years of diversified proven leadership and experience in Architectural Planning & design, supervision, Teaching, Administration, Facility Management, , Project Execution and Infrastructure Planning.

Abstract

I feel that in today's professional fora, specifically in India the most hyped & the most superficially used word is 'sustainable'. It is mostly frequented with respect to 'environment', 'architectural or planning susceptibility' or in the context of existence of living beings. It's fair enough to bring forward, evolve, introspect & assimilate such ideas if done with the level of seriousness which it deserves where it doesn't seem to be happening. Be it any architectural platform of seminar, symposium, forum or a conference, one is bound to hear several utterances of this word without which one is not considered to be 'environmentally updated'. The prime motive in the environmental context is losing its ground to the likes of gaining attention in public domain & social media.

1. INTRODUCTION

A lot is being done but still much more can be done & needs to be rather than warming-up in cocktail circuits & meaningless gossip on this subject. It is not the rampant usage or glorification which perturbs me but the impetuous & impractical measure with which it is dealt with. We all are well aware of the day-to-day ecological deterioration happening worldwide wherein our natural assets are being threatened & being turned into disasters. The need of the hour needs to genuinely introspect , educate, plan out measures to curb the threatening deeds & discover alternate means to minimize the threat along with creating strengthening our ecological inventory. This can only be taken up when :-

- The public at large be made to participate in the decision-making process through their chosen representatives. Keeping them educated , apprising about the manner of handling the situation as well as warning them of the strict penal implications.
- The planning process involves all concerned agencies from departments of environment, Forests & climate change, natural resources, water works, mining, rural & urban planning to the civic agencies & all ancillary bodies including NGOs even distantly being impacted by it, interacting under a common agenda to enable better means to survive. This shall bring about the blue print of the final approbation from where the implementational agenda may begin within the prescribed ambit of Law & regulations.
- The planning outcome cannot bring conclusive results unless we have interactive & efficient agencies to execute the programme till the grassroot level of the society. The norms are required to be made stringent & responsibility inculcated into lifestyle of the public at large.

- The Master plan of urban centers needs not only to implicate the guidelines pertaining to the demographic, land use allocations, infrastructural & Landscape facilities explicitly focusing on the waste disposal, it's treatment, ground & surface water management, enforcing plantations strict prohibitions , curbing of malpractices. All this to ensure within stringent guidelines for their abidance in consonance with the local bodies.

This has multi-faceted aspects to it out of which I feel that Landscaping also forms a key element which contributes in mitigating the environmental hazards which is being faced & which is bound to deteriorate unless controlled by strategically planned methods & means. Having said that, I have been into some research work pertaining to the upgradation of a centralized Landscape arena in the Shahdara zone titled '**Revitalization of Shahdara pond** ' which primarily inhabits low-income strata of the society with a high concentration of populace.

2. METHODOLOGY OF THE STUDY

The Ministry of Tourism , Govt. Of India has taken up proposals for the development of lakes. For the enhancement of Tourism infrastructure, the authority had offered outdoor leisure facilities for tourist & residents, as most of the lakes in the area have disappeared due to change in use of land & due to non-retention of water. As the population increased, several such water bodies were encroached upon, many shrank due to catchment loss & a few actually dried up. **The population explosion & environmental exploitation resulted in the direct threat to the existence of the traditional 'Baolis' (step wells), water bodies & tanks /ponds.**

There are 629 water bodies identified /acknowledged by the Delhi government. **Lakes identified by INTACH 3** – 44 lakes, 375 village ponds- **Only 22 lakes remain**. These thrust areas are now finding expression to **revive the SHAHDARA LAKE** of east Delhi with a huge catchment area to cater to the recreational needs of the society. This was a natural low-lying area, land depression where rain water collected. **Thus, it is proposed to make a recreational cum cultural centre at Shahdara lake**.

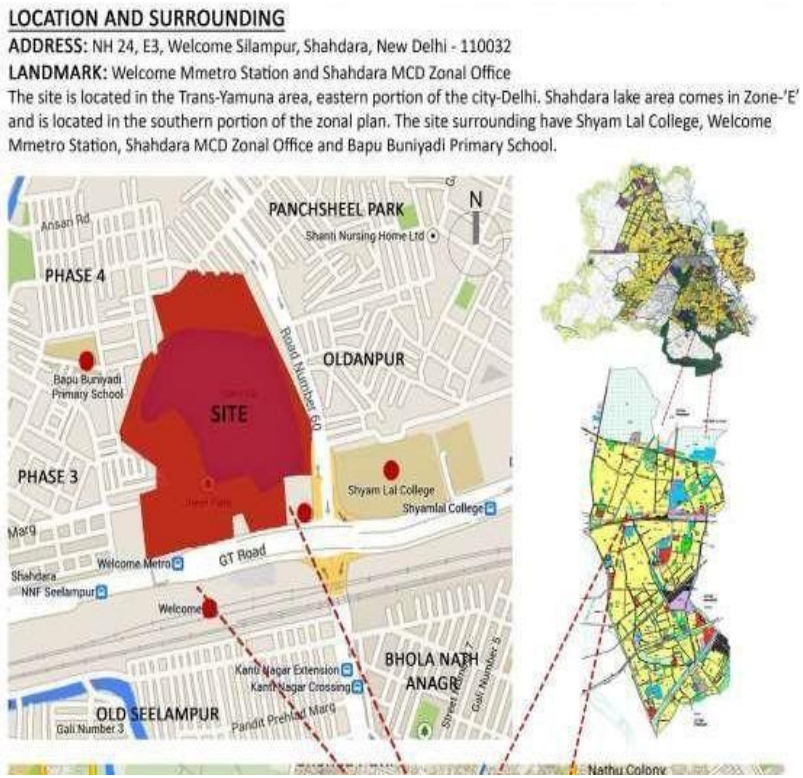

Fig 1: The lake which is spread over **14 acres** out of a total area of approximately **30 acres** was envisaged to offer boating facilities. Walkways around the lake, community interaction, social functions & leisure pockets. **Five acre space** was to be developed for the recreational facility**.**

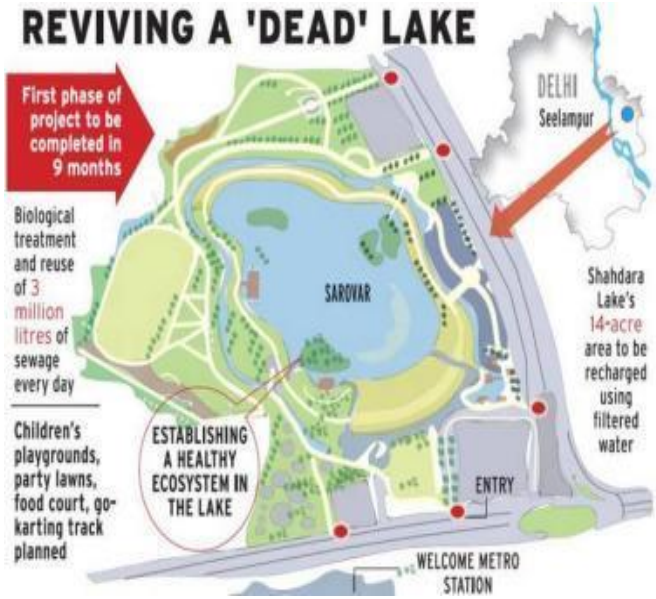

Fig 2: Tragic Reality and challenge of today

With only about 25% of the entire site being put to re-development the Govt. initiative & vision of revitalization of the Pond with sustainable development is far from being achieved. Only a large patch of about 2 acres has been developed into a garden with adequate plantations, play area, garden furniture & walkers trail but the lack of access control, poor maintenance, thoroughfare for locals have made into a haven for crime & an aversion for genuine users.

With 14 acres of area once brimming with water presents a very sorry state of affairs with all water having been completely dried up with only depressions & undulations seen in topography with piles of garbage devoid of vegetation, only being used as a thoroughfare for neighborhood.

Fig 3: No water in sight in what was a pond brimming with water. Only a shallow dry depression.

Fig 4: The area can be seen with piles of un managed garbage & litter. With only some partial uses (20%) opened in 2001, the campus vision & maintenance is far from adequate to fulfil the basic purpose of this project vision was good but a failure of maintenance agencies

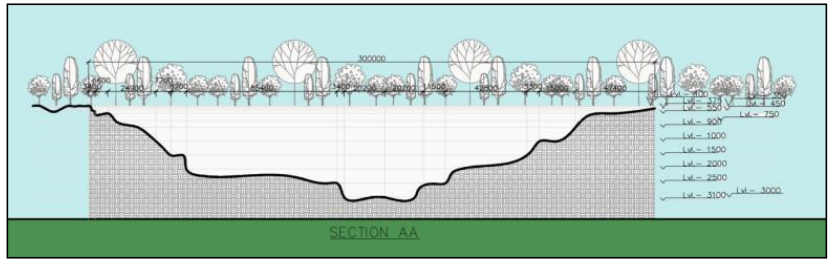

Fig 5: longitudinal section showing the profile of the site strata

3. RESULTS AND THE PROPOSED SOLUTION:

Table 1: SWOT analysis

SWOT ANALYSIS

STRENGTH: • 14 Acre Water Surface- an Enormous Lake. • Welcome Metro Station, bus stops and Delhi Shahdara Junction enhancing the connectivity. • Proximity to the other colonies of east Delhi. • Large area of approx.. 30 acre land.	**WEAKNESS:** • Not utilized as not maintained. • Dump Storage in the Vicinity. • Wild bushy plants. • No basic services such as eatery joints, toilets. • Dried lake. • Poor infrastructure.
OPPORTUNITY: • As Ministry of Tourism has proposed Recreational cum Cultural Place and also East Delhi lacks in cultural facilities, hence to create spaces for Recreational cum Cultural facilities in the provided area along with the Revitalization of lake. • Landscape development of Shahdara Lake to be done in a way so as to facilitate physical connection with the surrounding neighborhood. • Redesigning the area with provision of better amenities. • Sidewalks facilities and design improvement. • Improving the existing recreational potential aspects with provision of seating and enhancing accessibility to whole site. • Provision of eating joints with proper seating.	**Threat:** • Dump Storage on the site. • Litter generation. • Crime issues.

3.1 Project motives

The attainment of target requires the following :-

- Effective & consistent functioning of STP which is the source of regular water input.
- Maintenance of inflow route to keep it clear of unauthorized tappings & blockade.
- Managing the Duckweed treatment lagoon en route.
- Operation of vertical aerator fountains.
- Maintaining fish population.
- Manual removal of leaf litter from the lake.
- Bacteria dosing

Table 2: Summary

	OBJECTIVES	MEASURES	INITIATIVES	PERFORMANCE INDICATORS
Economic	- Long term financial sustainability - Bringing down cost of water supply including tankers and bore wells	- Recovery of capital cost - Cost of water supply - Life cycle cost	-Using existing STP as water source - Using natural gradient of land toreduce pumping costs - Using cascade aerators to reduce electricity costs	- Capital cost recovery within short period due to reduced cost of water supply - Annual maintenance cost recovery in terms of health and recreation
Environmental	- Restoration of lake and surrounding environment - Recycling of water - Raising of Groundwater Table	-Water quality(CPCB norms) and Quantity -Ground Water Level - Per Capita Water availability - Revival of lake ecosystem	- Using treated water from STP as a continuous water source -Frequent water testingby CPCB -Additional bioremediation of water - Composting of collected waste - Introduction of fish to tackle algae/weeds- Using aerators	- Permanent presence of water in the lake - Water Quality in accordance with CPCB norms for lakes -Rise in groundwater table - Ease of watering in adjacent parkland - Reuse of waste as compost -Presence of variety of waterbirds
Social	- Increasing water availability - Enhancing aesthetic value - Creating recreational space - Improving public health	- Better household water supply - Aesthetically pleasing surroundings - Number of visitors - Air and water quality	- Development of adjacent parkland - Provision of boating -Creation of walkways and shelters - Introducing moving fountains in the lake - Spraying insecticides for mosquito removal - Public discussions to explain benefits	- Increased satisfaction with domestic water supply - Increase in visitors in the surrounding areas - Increase in morning walkers -Increase in photographers and birdwatchers - Visitor satisfaction

The broad objectives were to :-

- Enrich the local groundwater regime
- Enable sustained tube well operations in the area
- Substantially add to the visual appeal / aesthetics of the area
- Cool the microclimate
- Offer recreational possibilities
- Increase soil moisture to support enhanced vegetation growth in localized area.

CONCEPT STATEMENT

There primary objective is to create an efficient, durable infrastructure that will foster entirely new uses in addition to supporting current day activities. Strategies include creating large
pedestrian zones along the lake's edge, creating access points to the lakefront, enhancing recreational potential by improving public facilities, conserving and encouraging overall development around it.
Placement of different activities in a harmonious relation so that positive aspects one activity can be shared by other activities while the negative aspects one activity can be overcome by the other activities and different cultural and social zones can become a magnet which will also helps to grow to its surrounding. In my vision Shahdara lake surrounding have multiple activities to attract people of different intrest. If a person come for one activity, he is also interact with other spaces either physicaly or visualy.

Shahdara lake will be revived as a spectacular icon of the district and territory by adding different design elements of green ribbons, reflecting water bodies, pathways and green roofing. By considering the different ideas of the water catchment and purifying techniques, concept will hold the principle of sustainability into the site by incorporating new ideas while assimilating the local climatic characters and culture of the community.

3.3 Evaluation & execution techniques

Existing ground water quality was evaluated for monitoring the post-project influence on the ground water quality.

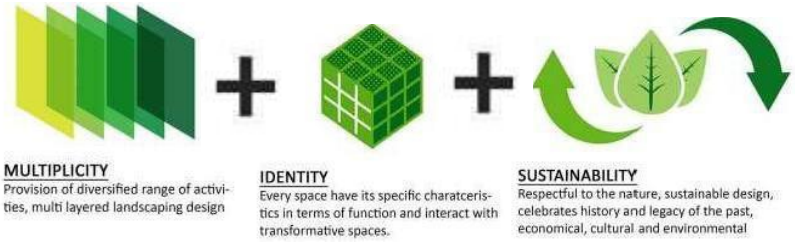

Fig 6 Multiplicity, Identity and Sustainability

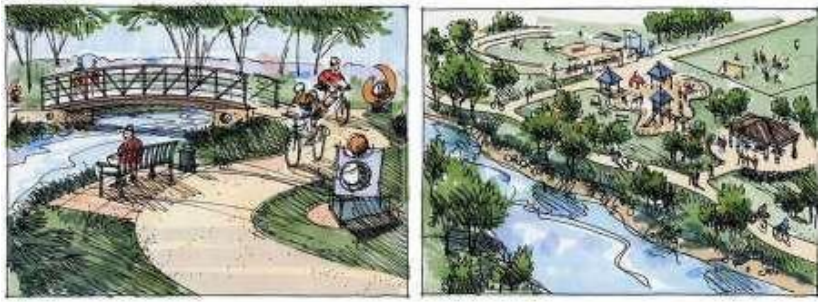

Fig 7: Another Example

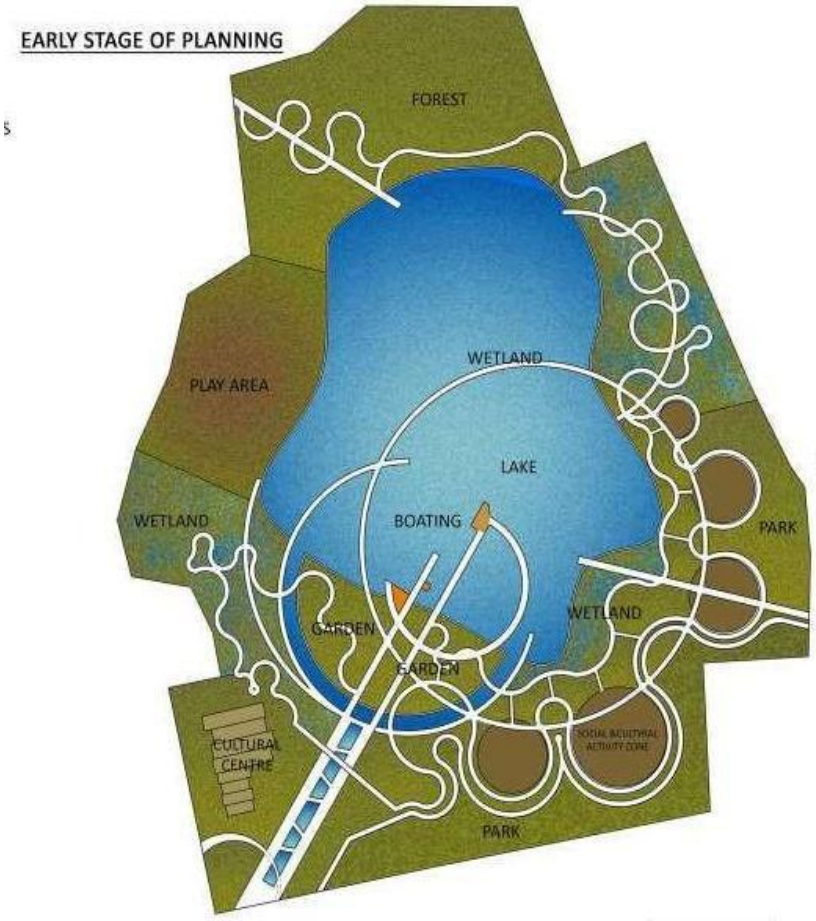

Fig 8: Early Stage of Planning

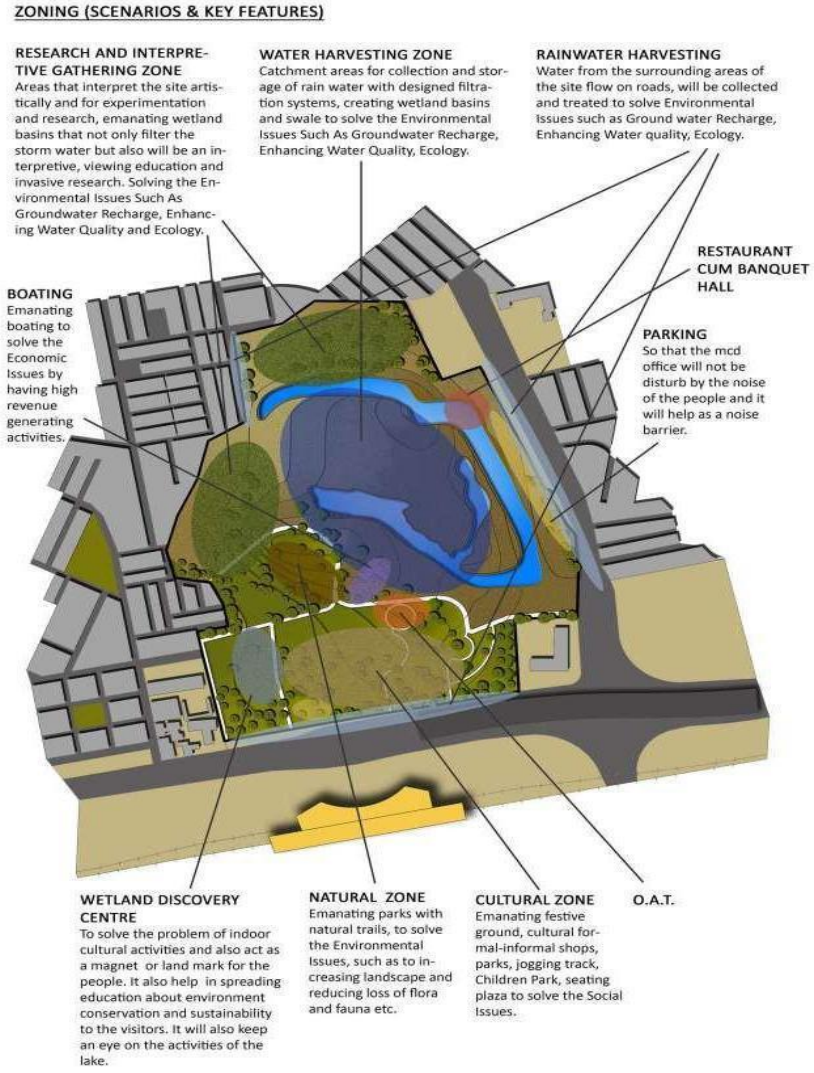
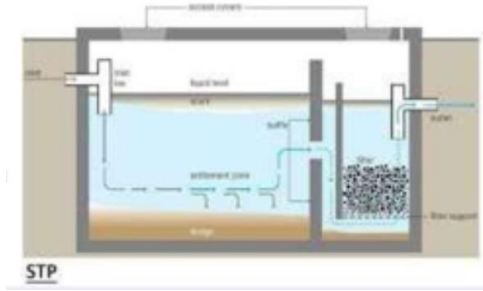
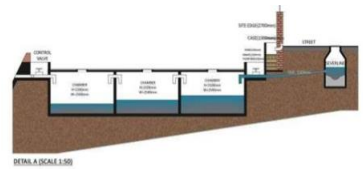
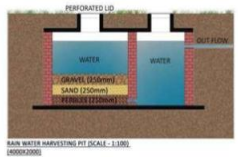
3.4 The proposed solution

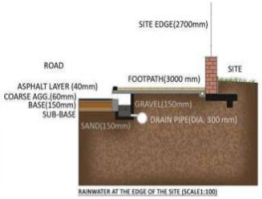


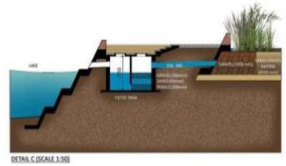
4. SITE VIEWS AND DETAILS PROPOSING ECO-FRIENDLY MEANS

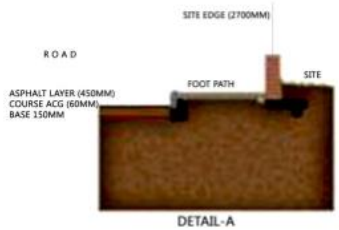


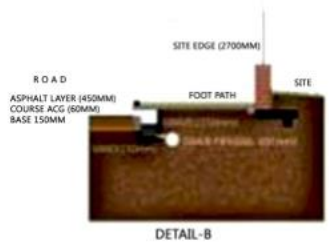




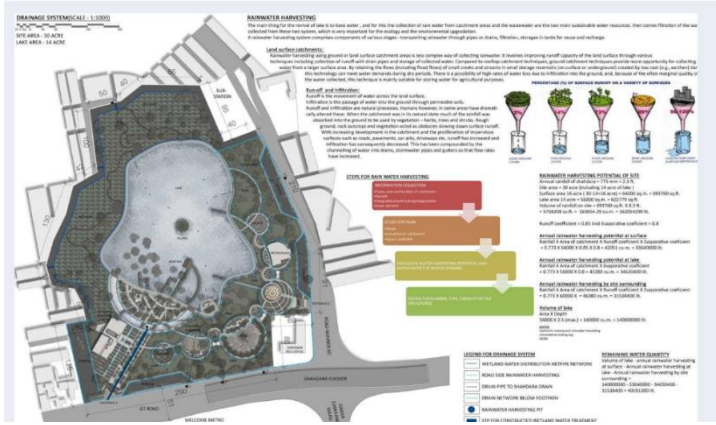








SERVICES PLAN



5. CONCLUSION

The proposal as made undertakes to rejuvenate a central location oEast Delhi with the kind of conveniences which have been lacking until now. It proposes to emphasize in :-

- **Stimulating & conserving the Biodiversity** of the region by vitalizing the pond & the area around it which shall encourage **aquatic plants & fishes**, native plantation in abundance, **promoting the water percolation** & thereby uplifting the water table & also inviting various species of birds.
- The aspects of **recreation, cultural interaction, tourism, water sports** & leisure activities shall not only facilitate the densely-populated neighborhood areas but can act as a safe haven for children playing around & picnic outings.
- Such a proposal serves rightly to divert the treated water from STPs to get diverted to irrigate the vegetation & to maintain the pond.

Though the project scores well on all three fronts viz. **economic, environmental and social,** there is scope for improvement, particularly on the social front.

- **There should be better publicity of the environmental benefits of the project, enhancing environmental awareness, especially of the local community.**
- By publicizing and explaining the water quality parameters it may be possible, in time, to completely remove the mental block that many residents have against recycled wastewater.
- Since the site combines history and nature, it can be projected as a **major tourist spot** of the city.
- East Delhi shall have a sizable arena for recreation & interactive facilities which is missing until now. **The site has already an easy & smooth access** in the form of Metro corridor & road transport.
- arena.

Making the project self-sustainable is one of the prime motives of the project by harvesting rainwater & re-circulation of liquid waste after treatment from the STP, solar power to enable the lighting of the entire arena, suggesting hardy evergreen & flowering trees to bring down the cost of maintenance as well as give the required aesthetic ambience to the arena.

6. FUTURE MEASURES TO MAKE THE PROJECT SELF-SUSTAINABLE

Fig 9 : Solar Lights

How Slum Sprawl : Lucknow as a Case

Ar. Riyazul Samad Binmohammad

GCA Alumni/2016 Batch

Experienced Assistant Professor with a demonstrated history of working in the education management industry. Skilled in AutoCAD, Urban Planning, Rural Planning, Design Management, and Feasibility Studies. Strong education professional with a Master of Urban Design from School of Planning and Architecture, New Delhi. Presently Assistant professor at Institute of Architecture, Chandigarh University. Member of Charted Institute of Architecture and Technology, UK and B-Sustainable Council, UK.

E-mail Id: ar.riyazulsamad@gmail.com

ABSTRACT

Lucknow is the capital city of Uttar Pradesh. Lucknow, known for its historical and political significance, is also the urban city. Rural people migrate to an urban area in search of better employment, amenities, and opportunities, summing up 'In Search Of a Better Life'. Migrated rural poor people with their lack of skills and exposure to the highly competitive market are forced to settle in inhabitable conditions, this adds to the expansion of SLUMS. The second part of the article is based on several physical surveys of Lucknow major slums. Try to portrait the life condition in slums and their thought about slums and their neighbor's thoughts also. "Now-a-Day slums is the major problem and every city, state and country have to persist it. The need of the hour is To Upgrade and Enhance the quality of life in the Slum or stop origins of slums."

KEY WORDS : *Slum, Slum sprawl, Urbanization, Urban, Rural-Urban Migration, Unauthorized Settlements and Informal Settlements.*

INTRODUCTION

SLUM is a word with Myriad Meanings as the definition varies from Person to Person, city to city or country to country. Because every city has different types of communities and their respective living standards. Every individual has its different perception of slums. Perspective varies as a slum dweller have a different perception for slum and LIG, MIG, HIG dwellers have a different perception for slum.

Now a- days everyone wants an urban lifestyle. Nevertheless, urban growth, especially in the metropolitan areas, has been exploitative and chaotic, resulting in rising unemployment and low productivity work-sharing in the informal sector, squatting in teeming slums, congestion, encroachment on public space, water, and air pollution and deteriorating infrastructure and services. look better than an ordinary slum.[when told it was supposed t be a slum"

The various definition given by sources are stated as follows:

- *Slum, Densely populated area of substandard housing, Usually in a city, Characterized by unsanitary conditions and social disorganization. (Source Britannica)*
- *Slum, overpopulated area with lack of amenities (Source WHO Report)*
- *A slum may be defined as a structure encroachment in the heart or beside the industrial boundary of the major cities and town (Source U.P. Govt.)*
- *"well, this slum cost a lot of money. It should look better than an ordinary slum.[when told it was supposed to be a slum" (Source: Samuel Goldwyn Quotes, Polish-born American movie Producer)*

These definitions of slums cast varied perceptions for slums. If we compile these ideas "a slum is an area which has an organic growth, unhygienic life condition and lack of amenities".

FORMATION OF SLUMS

It is evident that the new individuals/groups, who approach the city to seek employment. The country people as they try to adjust to the growth pace of the city, are forced to settle with an underrated life standard. Consequently, they create a new type of residential settlement in contradiction to that of the existing urban groups. Since the new groups are mostly constituted of low-income groups of rural migrants, they accept whatever accommodations are available for them. It can be quickly erected with waste materials or with those that can be procured on low costs on open spaces that are unusable or lying vacant. Generally, the operation takes place in groups, initially consisting of relatives and kins or members from the same caste, village, district, region or language. This process involves illegal occupancy or squatting on government or private lands. They occupy the piece of land illegally. A noticeable aspect of these settlements is their location to the workplaces.

URBANIZATION AS A PROBLEMS

Urbanization has been accompanied by the growth of population and slums from the very inception of the urban world. Urbanization is increasing at a rapid rate and the available supply of land and housing in the urban centers cannot accommodate the surging squatter population. People are, therefore, illegally occupying land and creating their shelters, residing in the deplorable living conditions. One of the varying problems confronting many of the developing nations in the world today is the illegal occupation of land, which is generally called squatting. The population in these areas increases at a much faster rate at two or three times the rate of the urban population as a whole, while the health services, employment opportunities, and social services do not increase correspondingly. As such, the lifestyle of many of the households staying in these areas starts deteriorating, facing extremely difficult conditions leading to anti-social elements and crimes and much needs to be done to improve their predicament.

LUCKNOW AS A CASE

Lucknow has a population of 3,647,834 persons with a large number of poor people in the city, and slum dwellers 584,865 persons and 16.03 % of its total population. Slums/vulnerable population clusters are scattered throughout the city. The major spots where vulnerable population clusters are mushrooming are in the river bed of the Gomti, in the vicinity of railway tracks and specifically in the fringe areas of Lucknow-Faizabad road, which is encroached upon by slum dwellers. Various estimates suggest that more than 60% to 70 % population of the city lives below the poverty line. DUDA, OXFAM, and RSAC have conducted studies to estimate the total vulnerable population and location of slums in Lucknow city. In Lucknow, both authorized and unauthorized slums exist. According to OXFAM, there are 787 identified slums existing in Lucknow. we have done several physical surveys in different areas slums in Lucknow. and selection criteria were based on land value(Vikas Nagar), type of origins(Daliganj Pul) and type of employment Railway colony). If we talk about Vikas Nagar slums, the Vikas Nagar is a very rapidly developing area in Lucknow. So that is why they are a lot of opportunity for labors class. people migrate from outside and work in construction, settled in vacant land.

There are eight exiting slums but more are growing. Growing at outer ring road as shown in the map, has been developing for 15 years. This slum started with 10 -15 dwelling units and now its count is 500-600 dwellings. These people migrated (Due to lack of amenities and financial aids) for employment in the city.

They don't have proper access to any basic amenities such as sanitation or water. On average 4-6 persons exist per family. Men mainly working on daily wages and Women are mainly working (washing, cleaning, etc.) in the vicinity comprising of residential Units (Vikas Nagar). These people don't have awareness of education. 2-4 working people exist in a family Monthly household income (savings):- 2000-3000/- Rs. Due to an unhygienic lifestyle, some people suffer serious diseases and they don't have enough money for their treatment.

CONCLUSION:

Conclusion came upon on the basis of interaction, survey, and interviews slum dwellers, they exchange their thoughts with us.

Table 1: District level indicators, Lucknow	
Population – District*	3,647,834 persons
Urban population-District*	2,320,961 persons
Slum population-District***	584,865 persons

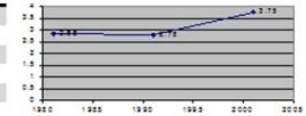
Figure 1 Location of Slum

Table 2 Estimated Population & Slum Population in Urban Uttar Pradesh & Lucknow , 1981-2001.

No	Year	Population (Lakh)					
		Total			Slum		
		UP	Lucknow UA	%	UP	Lucknow UA	%
1	1981	199.0	10.07	5.06	25.8	2.85	11.05
2	1991	276.1	16.69	6.04	58.4	2.78	4.76
3	2001	365.4	22.58	6.18	77.1	3.75	4.86



Some say they are happy to stay here. We can't leave this place. These type of organic settlement not only face enormous problems regarding basic facilities but also causes environmental pollution. Slums are an aspect associated with the Indian Society and the dimension is unbootable. The studies associated are superficial as the facts are quantitative and not qualitative. People living in these unknown Sprawls of Life, face a serious dilemma as to whether the Government has enough Resources and Mostly time to notice the requirements of this class, and hence they compromise with what is thrown at them and couldn't gather enough guts to raise their requirements. On the Other Hand, Government and other Official Units should realize that Development is not a segregated process, it is a unanimous one and every class of people is interdependent.

For Instance, The government of Uttar Pradesh Proposed a housing scheme for the slum inhabitants of Lucknow, But the Location of the units was much distant from the urban Sprawl and this cut-off the employment opportunities of these people, which actually led to Economic depletion, Hence they moved again to these slums to stay intact with the urban employment opportunities.

As correctly stated," Once a Rotten Rooted Plant always remains the same, till we don't add manure and Water It properly".

"We want to stay here because we get easy employment and amenities. We expect from government for shelter and other basic amenities (which is now in worst condition)" : Slums Dwellers . Source:-base on survey and Interview of slum dwellers by author .

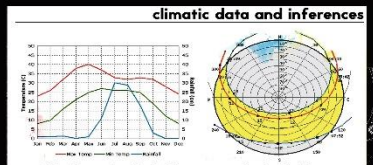
climatic data and inferences



winds during monsoon from south-east and cold dry winds from north-east

Lucknow has a warm humid subtropical cl mate with cool dry winters from decembar to febraury and dry, hot summers from april to june.

Summers: are vary hot with temperature rising to 40deg. to 45deg.
Winters: In winters the maximum temperature around 25 to 30deg. and minimum around 2 to 5 deg.

INFERENCES:

. since the site is located in open and exposed periphery, the landuse must have comfortable and covered area for the people us ng the site.
. The immediate impact zone is radially 1.5 kms , hence to cater such a large population basic activities of people should be synchronised as functions in the landuse.
. No Prime soil present as the area is away from river bank so no agricultural amenity needs to be provided.
. The Vendors and the Vagrant Workmen should be provided a shelter in the landuse, as they are an identity for the site.

GROWTH PATTERN OF LUCKNOW
THE GOMTI RIVER, A TRIBUTARY OF GANGA RIVER SYSTEM IS THE CHIEF GEOGRAPHICAL FEATURE, MEANDERS THROUGH THE CITY, DIVIDING IT INTO THE TRANS-GOMTI AND CIS-GOMTI REGIONS.. ALMOST PRESENTLY BIFURCATES THE CITY OF LUCKNOW INTO TWO PARTS: THE FIRST PART FORMING THE CORE OF NAWABIAN AND BRITISH EVOLUTION OF THE CITY STRUCTURE AND FORM, WHILE THE SECOND HALF IS THE URBAN SPRAWL OF THE POST-INDEPENDENT EVOLUTION OF THE CITY STRUCTURE AND FORM.
LUCKNOW IN 1858
PRESENT DAY GOMTI NAGAR
DEMOGRAPHIC FEATURES OF LUCKNOW
POPULATION OF LUCKNOW (1901-2001)
THE PRESENT CITY OF LUCKNOW HAS BEEN DIVIDED INTO 40 WARDS AND A CANTONMENT WITH A POPULATION OF 22.67 LAKH PERSONS (2001 CENSUS) AND COVERING AN AREA OF 337.50 KM2.
PHASES IN THE PHYSICAL EXPANSION OF LUCKNOW
BRIGADIER GENERAL SIR ROBERT MAYER DREW A PLAN FOR THE CITY WHICH WAS DESIGNED FOR THE DEFENCE OF THE CITY.
CITY OF LUCKNOW ORIGINATED AROUND THE LAKSHMAN TILLA AND MACHCHI BHAWAN. IT IS CONSIDERED AS NUCLEUS OF THE CITY.
CITY EXPANDED BY THE LEFT BANK OF THE RIVER GOMTI.
IN CASE OF LUCKNOW EARLIER ROADS WERE DEVELOPED BY THE SIDE OF RIVER GOMTI IN A SEMI-CIRCULAR WAY.
THE CITY WAS EXPANDED ACCORDING TO ROAD NETWORK.
IN 1866, NISHATGANJ BRIDGE WAS CONSTRUCTED ON RIVER GOMTI NEAR HAZRATGANJ. BRIDGE FOR DEVELOPMENT OF EASTERN AREA (MIXED COLONIAL STREET MODEL).
AFTER 1971, GROWTH DIRECTIONS THAT EMERGED AS A RESULT OF SOCIO-ECO-NOMIC INVESTMENT AND INSTITUTIONAL INTERFACE ARE:
1. ALONG FAIZABAD ROAD
2. ALONG SULTANPUR ROAD
3. ALONG KANPUR ROAD
4. ALONG SULTANPUR ROAD
5. ALONG HARDOI ROAD
THE MASTER PLAN (1991 ONWARDS)- LUCKNOW METROPOLIS FOR THE YEAR 2001 EXTENDS OVER AN AREA OF ABOUT 23000 HECTARES, PROPOSING EXPANSION IN ALL DIRECTIONS. THE CANTONMENT BARRIER HAS BEEN OVERCOMBER PROVIDING A PERIPHERAL ROAD, THEREBY OPENING UP POSSIBILITIES OF DEVELOPMENT ALONG SULTANPUR ROAD AS WELL
POPULATION GROWTH OF LUCKNOW
LUCKNOW IS GROWING AT UNPRECEDENTED RATES, CREATING EXTENSIVE URBAN LANDSCAPES. LUCKNOW HAS CHANGED FROM SMALL, ISOLATED POPULATION CENTER IN EARLY 1990'S TO A LARGE INTERCONNECTED URBAN COMPLEX TODAY HAVING DIVERSE ECONOMIC, PHYSICAL AND ENVIRONMENTAL
SPRAWL OF THE LUCKNOW CITY (1901-2021)

REASON FOR TOURIST FALL
FREFERED PLACE
INFERENCES
.082 million population increases every year.
Reasons of population growth:
a) People are migrated from rural to urban area.
1. For education demands
2. For increase in work force
With increasement in population , density per km. is also increasing.
Residential density,decrease in the number of rooms per household and finally housing shortages.
Increase in the workforce ,it means an increased demand for office and commercial space.
High % of literates due to development of planned cities and have settled with good education background.
May be following reason of growth of population in gomati nagar :
1)Traffic
2)Noise pollution
3)air pollution
4)Building of required commercial spaces and public spaces
New development and away from central hub of the city and the roads are also wide.
Most visited place by tourist is ambedkar park having 1500 people per day.400-500 people per day in lohia park and 40-50 people per day in JPNM and 130-150 on saturday sunday.

GOMTI NAGAR RAILWAY STATION

"FRAMING A URBAN DIALOGUE TO THE CITY"
DILINEATING - transparency of the lucknow ,adapting various artforms and architecture and hence formulating its own style.

concept
gomti river :
TRANSPARENCY & CONTINUITY

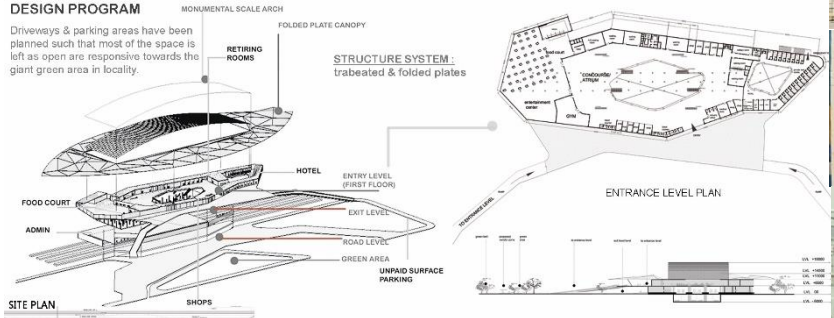
URBAN DESIGN STUDIO EXERCISE

SIDE ELEVATION

FRONT ELEVATION

DESIGN PROGRAM

Driveways & parking areas have been planned such that most of the space is left as open are responsive towards the giant green area in locality.

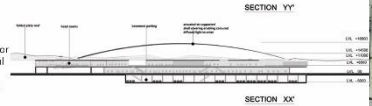


STRUCTURE SYSTEM :
trabeated & folded plates

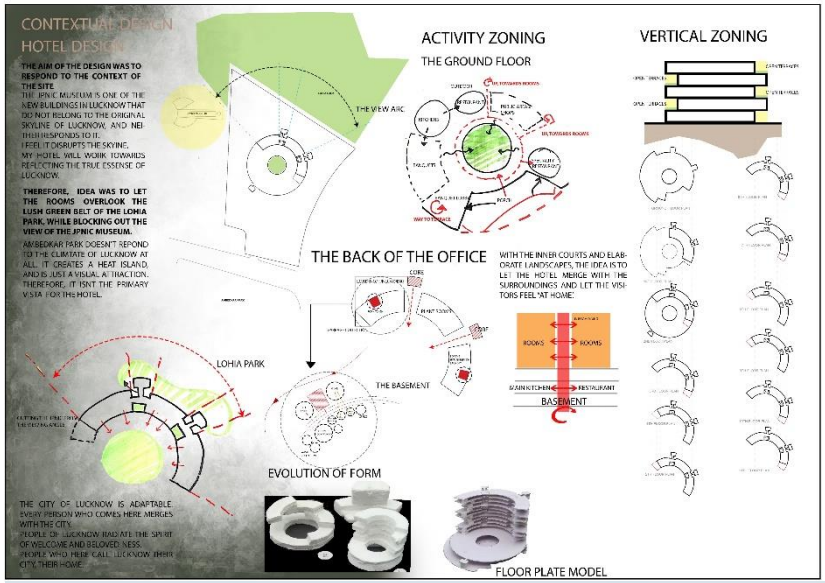
SITE PLAN

DESIGN PROPOSALS

1. Proposing a vendor zone incorporating the economical benefits for the local people.
2. Providing the stepped seating beside the vendor zone,and strategically placing under the natural shade of green areas.
3. Incorporationg street furniture and developing street scape.



4th Year



CONTEXTUAL DESIGN
HOTEL DESIGN
THE AIM OF THE DESIGN WAS TO RESPOND TO THE CONTEXT OF THE SITE
THE JPNIC MUSEUM IS ONE OF THE NEW BUILDINGS IN LUCKNOW THAT DO NOT RELONG TO THE ORIGINAL SKYLINE OF LUCKNOW, AND NEITHER RESPONDS TO IT.
I FEEL IT DISRUPTS THE SKYLINE.
MY HOTEL WILL WORK TOWARDS REFLECTING THE TRUE ESSENSE OF LUCKNOW.
THEREFORE, IDEA WAS TO LET THE ROOMS OVERLOOK THE LUSH GREEN BELT OF THE LOHIA PARK, WHILE BLOCKING OUT THE VIEW OF THE JPNIC MUSEUM.
AMBEDKAR PARK DOESN'T REPOND TO THE CLIMATE OF LUCKNOW AT ALL. IT CREATES A HEAT ISLAND, AND IS JUST A VISUAL ATTRACTION. THEREFORE, IT ISN'T THE PRIMARY VISTA FOR THE HOTEL.
THE CITY OF LUCKNOW IS ADAPTABLE.
EVERY PERSON WHO COMES HERE MERGES WITH THE CITY.
PEOPLE OF LUCKNOW RADIATE THE SPIRIT OF WELCOME AND BELOVED NESS.
PEOPLE WHO HERE CALL LUCKNOW, THEIR CITY, THEIR HOME.
ACTIVITY ZONING
THE GROUND FLOOR
THE VIEW ARC
VERTICAL ZONING
THE BACK OF THE OFFICE
WITH THE INNER COURTS AND ELABORATE LANDSCAPES, THE IDEA IS TO LET THE HOTEL MERGE WITH THE SURROUNDINGS AND LET THE VISITORS FEEL "AT HOME"

CONCEPT
Lohia Path provides visual distribution between smooth edged & sharp edged building. One side of the building on lohia path consist of Ambedkar park which shows the smooth building profile through domical structures and curved facades and on the opposite side it consist of J.P. Narayan Museum, JPNIC, Metro station all with very sharp edged profile. So to provide the visual balance among the buildings, the hotel which will be located at the corner of the lonia complex is designed as to provide both the smooth and sharp edged profile together. The building is oriented in a manner so that the visual balance of the area does not get disturbed.

Know Your Alumni 2013

"Know your Alumni" was yet another event that enlightened us about the alumni. Various PowerPoint presentations by architects about their practices and the diverse fields of work they have been engaged in made us aware of various ongoing scenarios in architecture.

Priyanka Narula's presentation on Digital Architecture shed light upon how software helps in design fabrication. Neelam Manjunath's talk on Bamboo Architecture was a helpful gesture as we came to know about the various techniques and sub-fields related to the same. Ar. Shaleen Singh who is the Head of department –Policy studies at T.E.R.I. also gave a presentation in which he discussed his acclaimed thesis work regarding sustainable architecture and its implementation. Ar.Kulveer Bhati gave a presentation on importance of branding in commercial world and role of designers in bringing maturity to a brand. He also presented his design works while he worked at Folly Design.

RAK CERAMICS

Just when you thought the best couldn't get any better...

Standards are never set in stone. They need to be set only to be broken to make way for something better & beautiful. And when you're setting standards in style, the more you set them, the more tempted you are to go one step better.

Just a fleeting glance at RAK Vitrified and Ceramic tiles and Sanitaryware is all that will take you to understand what we mean.

After all, when you're the world's best, you know you have a standard to set and a reputation to live up to.

VITRIFIED

CERAMIC

SANITARYWARE
