Message

37 years of heritage, immense dedication of hundreds of staff members and intense hard work of thousands of students come together today to celebrate the rich history of this college. This conglomeration not only celebrates the golden past but also strengthens the present and shapes the future. The formation of the Alumni Association is a moment of immense pleasure for each and every person who has contributed towards making our institute one of the most reputed institutes of the nation.

This college has produced some of the renowned architects of the nation and undoubtedly many great human beings. Our faculty and graduates have been recognized for their contribution to the field of Architecture and to the society at large at national and international level.

Though the alumni of the college have always been supporting and contributing to the college, it is heartening to see them coming together as formal association to expand their scope of contribution. This association will provide a forum for discussions and collaborative efforts focused around the upliftment/betterment of the college and its students. Senior architects coming together and sharing their experiences and wisdom would be an enriching learning for the budding architects of the nation.

The response of the alumni so far has been very encouraging and I hope that the enthusiastic participation continues in the years to come. I wish them all the success in taking this association to what we have dreamt it to be.

(Prof. Jagbir Singh)
Principal and Dean

Message

Experiencing the same place for the last 33 yrs. as a student and as a teacher I am still in the learning process. At last I have something very different to initiate the G.C.A. alumni association a great responsibility to inculcate the feeling of cohesiveness among our self and to continue the flame among upcoming budding architects of this college. Thanks to all those who loved me and gave me this opportunity to serve our alumni association and off course all of us have great responsibility to continue this flame even after me.....

I am thankful to all my fellow Architects for extending their faith in the existing executive body of GCA Alumni Association Lucknow. The GCA Alumni Association which came into existence under the able chair of Prof. Jagbir Singh during the council visit is working hard to strengthen our association in the benefit of our college, students of this college and our architecture profession. I am also thankful to all my colleagues, budding architects and Members of GCAAA for their cooperation and support to make this event successful. And finally the entire Alumni and executive body is highly obliged to all sponsors for their cooperation and support, without their participation we cannot make this event successful.

Any institution is known by its pass out students and existence of any student is by virtue of its alumni. This coupling is always required for the existence and growth of any institution. But there is one more factor which is usually forgotten, the struggle and sacrifices done by the pioneer batches. They are the foundation stones usually remains underground beneath the structures, lying unnoticed but without their existence the structure cannot stand above ground. In the history of this college we cannot overlook their sacrifices and emotional attachment with the institution. We cannot abandon those stalwarts who were responsible in the formation of this college way back in 1976. After their struggle this college was given an independent and separate identity as a Government college of Architecture.

from the desk of president gcaaa...

In the same continuation I would like to mention the names of our colleagues, who had started the alumni earlier. We must appreciate their efforts for their concern and emotional attachment with the college. They have provided a firm and strong base for the existing GCA Alumni Association.

The great name and fame associated with our college is largely credited to its Alumni, who are about 900 architects spread over entire country and abroad. However, this first formal Alumni Association of our college as on date and I'm sure that we all share the same strong urge to unite under one umbrella as a big & strong family. The Magical Synergy which is evident to unfold out of this platform would not only support our Alma Mater to excel its cause but also provide each one of us with ever increasing opportunities in the field of Architecture.
And finally this is my humble request and submission to the entire alumni community to come forward to strengthen our community.....and show their concern genuinely.....in the benefit of this college.....in the welfare of students of this college.....in the benefit of our community and profession.....Ameen

With thanks & warm regards

Prof. Mohammed Sabahat
President- GCAAA

Message

If I am to write about my memories of being in Architecture, it may not have much to say about the years spent on field, racing against an invisible competitor, towards an unknown finishing line. But most of the memories would rather be of those golden years spent on campus, learning lessons that would be with me for my life. All the twenty years post college may have passed in a blur, but the images of those five years are still vivid in memory.

Friends, these images maybe different for all of us but what is common is that our brightly colored canvas of professional success, owes its colours to our Alma Mater. It has given us the brushes, the paints and a ladder to access every corner of this giant canvas.

But now the time has come when it is the Alma mater that needs our masterstrokes, to colour it with our unconditional love. It is the time to re-erect the SHACK of our togetherness, to fill the DITCH of any professional rivalry creating a level playing field for our budding architects and to celebrate a new era, a new Dawn with our friends.

The working committee has been assigned this task, to DESIGN the foundation of Alumni association, by the present head of our family Prof. Jagbir Singh. Last date of submission is Nov. 9, 2013 with no scope of LATE submissions. Though our President is an expert of REPEATS, this time he is clear about getting a foolproof system in place in the very first attempt, duly supported by a strong team of dedicated Executive members.

I am sure that we all would want this endeavor to succeed and we are all waiting for the day when our bonds would be renewed, our disparities would be forgotten and our vow of "Giving Back" would be fulfilled.

Looking forward to welcoming you all,

Ar. Anupam Mittal
(Gen. Secretary)

चलो 'मिलते' हैं.....!!

ओस की टपकती बूँदों में, बहते हुए कोहरे का आगोश,
ठिठुरन भरी कंपकपाती वही जानी पहचानी, मखमली 'नवंबर' की ठंड,

यूँ ही अनमनी-टहलती, हज़रतगंज की वो 'रोमांटिक' सी शाम,
रंगीन भीड़-भाड़ में मशगूल अमीनाबाद,
वो टुंडए-कवाब की तरफ सकरी-तंग गलियाँ...
गोमती के पुलों पर वही, हरी-पीली पट्टी वाले पुराने-जर्जर टैंपो,
वही विशाल-बुलंद लखनऊ जन्क्शन का फैलाव-चारबाग,

वहीं आई-टी-चौराहे की तरफ अंजाने में कदमों का टहलते-टहलते पहुँच जाना,
'मंगली' शाम को वो हनुमान-सेतु पर घंटियों का, ट्रॅफिक हॉर्नस के साथ 'ताना-बाना'
'चौक' की देर-दराज की रोशन-चाँदनी रात,
नदवा-मनकामेश्वर के वही, 'मिक्स्ड-कल्चर्ड' पुराने ज़ज्बात,

हज़ारों वजह हैं दोस्तों, लखनऊ फिर 'जा पहुँचने की'-'आ पहुँचने की'.....!!

दिल में आज भी "हज़रतगंज की वो टहलती-रोमांटिक शाम" अगर क़ैद है तो....
रिक्शा देखे-बैठे अरसा हुआ हो तो....

वो कॉलेज की 'सीढ़ियाँ' जहाँ बैच-दर-बैच गुजर गये,
जो आज भी वहीं 'रुकी-बैठी' हैं, और, एक और फोटो की दरकार हो तो...

वो, छोटा गेट, जहाँ से पैदल निकले-आए-पहुँचे "उनके" साथ,
आज बगल के बड़े गेट से, गाड़ी में पहुँचो, कुछ अलग सा लगे तो...

तेज़ी से दौड़ती जिंदगी के कैनवास पर रुकी,
उन ब्लैक-एन-वाइट पिक्चर्स में फिर से रंग-भरना हो तो...
जनाब - जनाब: लखनऊ, 'जा-धमकिये' - 'आ-पहुँचिए'....!!

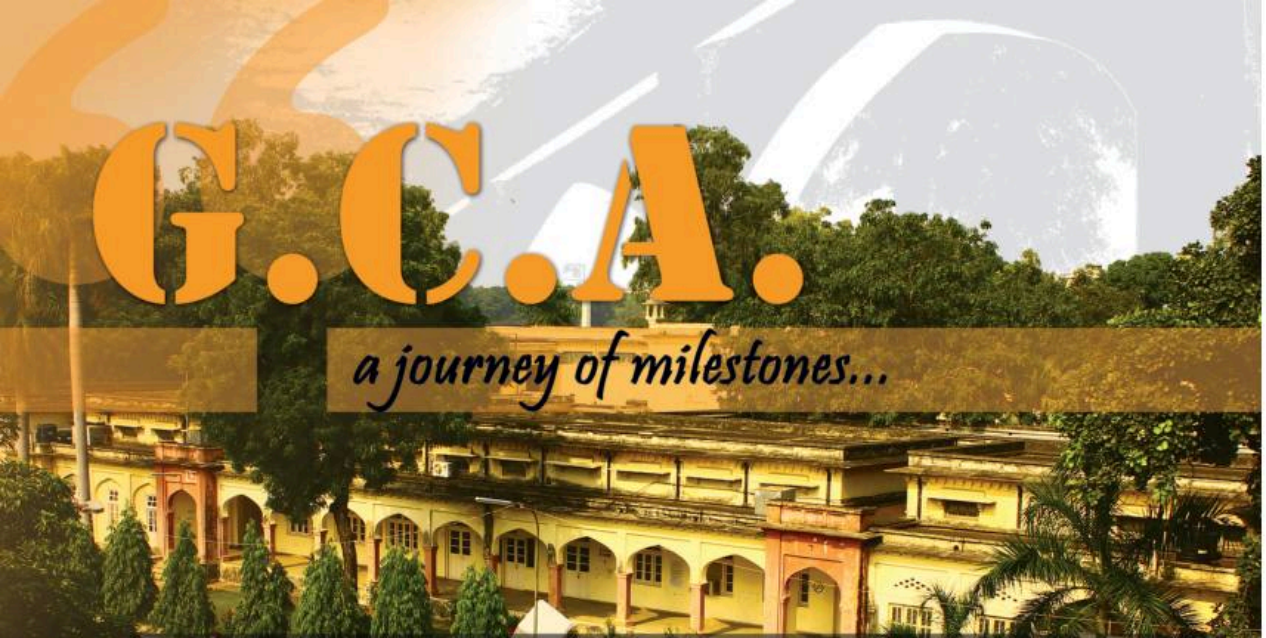

इस नवंबर 9-10 को मौका है - मोहलत है - हसरत भी - फ़ुर्सत भी.....
धूल के नीचे, यादों की, GCA वाली 'पोटलियों' को फूंक से फिर खोलते हैं...
चलो 'मिलते' हैं.....!!

G.C.A.

a journey of milestones...

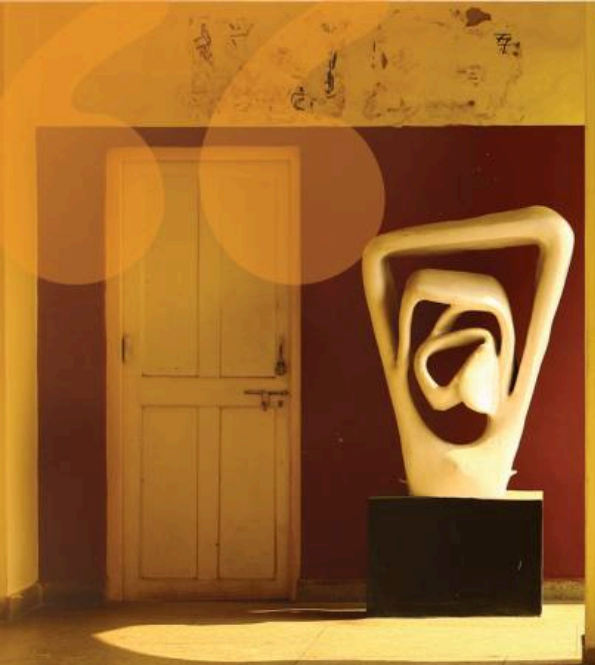

A chapter of Architectural history is going to be created in Lucknow when the first Alumni Meet of the Faculty of Architecture, GBTU, (erstwhile Government College of Architecture) takes place here on10th November, 2013 .

The Govt. College of Architecture, as it was formerly known, has witnessed more than 100 years of ups and downs. It has created and blended numerous personalities who not only made their contribution to the development of the State but to the Nation also. Although, in comparison to the life span of a person, the time spent in professional institutions is not much, but these are the moments of life when one shapes his career and start nurturing his dreams for the future growth of the community as well as of the Nation. These dreams later become milestones in the history of an Institution.

Lucknow had the distinction to have got one of the first 3 Architectural institutions, the British established in India way back in the year 1911. The other 2 institutions were created in Bombay and Baroda. Originally it was started on 1st November 1892 at Banarasi Bag,Lucknow which was shifted to Aminabad and Bans Mandi and finally in present campus after the construction of new campus at Tagore Marg, Lucknow which was constructed by PWD during 1909-1911.

The initial name given to the present campus at Lucknow was School of Arts and Crafts which included Architecture. The first Principal was Nathanial Herd and first Indian Principal- Sri Asit Kumar Haldar, who assumed the office in 1925, was a great visionary. He succeeded in introducing five years degree course in Architecture.

ALUMNI ASSOCIATION
GOVERNMENT COLLEGE OF
ARCHITECTURE | LUCKNOW

As mentioned earlier, in Lucknow, Architectural studies started more than a century back with full time five years diploma in Architectural design and draftsmanship. While other institutions were able to take a lead much earlier and were able to upgrade themselves to degree level courses, Lucknow College could start its five year degree course only in 1956 and inducted five batches till 1960. Ar. Jaswant Singh, is an alumnus of the first batch, who is known to most of us as a leading practitioner of his time in Lucknow. Prof. K.K.Dixit also belongs to this era, who became the faculty in the same college later in 1970.

After Independence, major changes took place in almost every sphere, including education. Many new departments/organizations were created among which Board of Technical Education was also set up by Government of Uttar Pradesh for diploma level studies, but no department or university could be set up for degree level technical education except at Roorkee, which was already in existence. Hence in the absence of an examination body for the Architecture program in Lucknow, the Architectural studies were continued in an uncertain environment. The then Lucknow and Agra University turned down the proposal of the State Government to conduct the degree level examinations and award the degree to the batches on the pretext of not having any technical faculty in their Universities.

At this junction, when the fate of the institution was in doldrums, a savior – a visionary from Indian Institute of Technology Kharagpur, Prof. D. C. Thapar took over the reins of the institute in the year 1960. Immediately after taking over, Prof. Thapar took a pledge to convert this sick institution into a pioneering institution in the Country. The courageous and multidimensional personality of Prof.D.C.Thapar proved a natural leader of the college. Under his able guidance, the dilemma came to an end and the efforts started to turn into reality. On his persuasion U.P. Government formed a high level committee for suggesting ways and means for improving the Architectural education in the State. The committee headed by Prof. Mandalia of Roorkee University recommended to the State Government to transfer senior students studying architecture in Lucknow, to architecture department of Roorkee University. While for remaining students -from first year to third year, the committee recommended that they be given an option either to continue their studies

G.C.A.

ALUMNI ASSOCIATION
GOVERNMENT COLLEGE OF
ARCHITECTURE | LUCKNOW

in Lucknow for a three year Diploma in Architectural Assistantship or to migrate to Roorkee University for degree level higher education, after passing third year examination from Board of Technical Education. The Government accepted the recommendations and all the desirous students were transferred to Roorkee in subsequent years. But due to the transfer of funds earmarked for the Lucknow college to Roorkee University, to make special arrangements for the migrated students, the financial health of Lucknow college deterioted so much that the five years degree program could not continue for long

and the college was forced to run only a diploma course in architectural assistantship since 1960, which continued till 1980. Although, the tireless efforts of a visionary personality could not succeed at this moment but he did not give up and enhanced his efforts for restoring the degree level program.

Still, Architecture program remained a part of the School of Arts and Crafts till 1975. In 1975 School Of Arts and Crafts was upgraded to the College of Arts and Crafts and a Faculty of Fine Arts was created in the Lucknow University. It is noteworthy that the University of Lucknow itself came into existence in 1921 by merging of Caning college and King George's Medical College. Again due to non availability of any technical faculty in the Lucknow University, the Architecture School was separated from the Arts College and was placed under the Department of Technical Education for examination purposes and Department of Cultural Affairs for finances and administrative control purpose. At that time it was renamed as Govt. School of Architecture.

It was the time of national emergency in the country when our batch was admitted in July 1976 and I was a hosteller which was common with the Arts College. It was not a pleasant time and there was tension amongst the students of both the institutions. An incident which took place in the month of August 1976 is still in mind, which I would like to mention here. It was a rainy night when the Architecture students were asked to instantaneously vacate the hostel at around 10.00 pm and to move into a store type dingy hall . Although all of us shifted alongwith our belongings to the hall after sweeping it we slept on floors (Without any bed) up to months. This incidence made a dent on our hearts. The situation remained tense for another 3 years till our batch reached to the final year of the diploma course. Later on we came to know that as ours was a diploma course, the students of Arts College did not consider us at par with them.
So to save the esteem of the School of Architecture, we all planned to fight for the same. After due consultation with seniors, we started an agitation against the U.P. Government to start a degree level course in Architecture also. The dream of our Principal awakened again and the strike prolonged for more than a year and all the three batches kept no stone unturned to succeed in the mission under the able guidance of

Prof. D.C.Thapar. Realizing that he has got right warriors with him, he immediately took up the role of a commander and guided all of us till the journey culminated into a success storey. In 1980 the State Government approved a new five years degree level course in Architecture after terminating the diploma program.

The institution was then renamed as Government College of Architecture and first batch was admitted in the year 1980 with the autonomy of conducting the examinations under the banner of Lucknow University. This college remained a government institution till the formation of U.P.Technical University in 2000,when it got affiliated with it and later ,after the division of UPTU, turned into a Faculty of Architecture of Gautam Buddha Technical University, Lucknow.
After the superannuation of Prof. D. C. Thapar in the year 1990, Dr. Sarla Sahu, Prof. Nehru Lal and Prof. Mulul Singh also nurtured this great institution as Principals. Since 2012, the Institution is being headed by Prof. Jagbir Singh and under his able stewardship; another milestone in the form of Masters Program in Architecture has been created in the year 2013. It is worth mentioning that one of the top most Architectural institution of this country i.e. SPA Bhopal is being headed by Dr. Ajai Khare- an alumnus of this great institution. Many others are holding top positions in government and private sector in India and abroad and are enhancing the glory of GCA.

This is the roller coaster journey of more than 100 years of existence of today's glory in short, that has spread through the globe. The fragrance of the institution is coming from around the world through face book. Definitely the blessings from the hearts of those faculties, who have mentored us, like Prof. D.C.Thapar, Prof.. K.K.Dixit, Sri Gautam Tiwari, Prof. Mukul Singh, Sri D.L.Shah, Sri R.S.Rautela, Sri K.S.Chauhan are still seen on the faces of everybody. We hope and wish that the college will definitely make a history in future also.

As a unique remembrance of the value system which prevailed in this great institution, narration of an incidence which occurred at the time of the thesis viva voce examination of the year 1996 appears necessary. The incidence goes as follows;

During the Thesis final Jury, at some point of time, one of the external examiners- Prof. J.C. Tayal of Roorkee University requested the internal examiner Prof. K. K. Dixit to discuss an important issue with the then Principal- Prof. D. C. Thapar (who for obvious reasons refrained himself from becoming a part of the Jury). Considering the gravity of the issue, Prof. Dixit advised to Prof. Tayal to come along with him to the Principals chamber. But Prof. Tayal refused to oblige him by saying since the Principal of this college did not extent the basic courtesy of having a cup of tea in his chamber with the external examiners, I would not like to go to his chamber at any cost. Then, Prof. Dixit had to himself discuss the issue with the Principal.
However, at the end, when the viva voce marks were entered in the award sheet and the double envelops were sealed, Prof. D. C. Thapar- the Principal, himself came to greet the external examiners and with an apologized tone, told them that he could not follow the basic protocol of greeting the external examiners, as his own son- Arjun was one of the examinees in this examination.
This was the level of moral of our GURUS, which ultimately transformed us to follow their foot steps.

Finally, we are very much grateful to all those who sacrificed with their time and money during the year long agitation which ultimately resulted in the re-commencement of degree course due to which we could become architects.

हाथी का नन्हा बच्चा...

हाथी का नन्हा बच्चा जैसे जैसे बड़ा होता गया, आश्रम के लोगों का प्रेम और आकर्षण भी बढ़ता गया। सब उसके साथ खेलते, प्यार करते और उसकी मनमोहक मुद्राओं के साथ उसको बड़ा होते हुए देखते। साँझ होते होते उसको एक वृक्ष के तले एक खूंटे से बाँध दिया जाता। दिन भर खेलकूद और मस्ती के बाद उसको रोज़ खूंटे से बांधना पड़ता था। गुरुओं की सीख मिलती जा रही थी और वह बच्चा दिन प्रतिदिन परिपक्व होता जा रहा था, ऐसा भी समय आ गया जब वो हाथी शाम होते होते खुद ही खूंटे के पास जाकर बैठ जाता था, मानो उसका एक अटूट रिश्ता सा बन गया हो उस खूंटे से।

बड़ा हो गया जब वह तो उसे जंगल में छोड़ दिया गया स्वतंत्र और अपने हिसाब से जीवन जीने के लिए। उसने अपना समूह बनाना शुरू किया, शक्ति अर्जित करनी शुरू की। दस,बीस ,पचास और देखते देखते सैकड़ों हाथियों का समूह बना लिया। चारों ओर उसकी ख्याति, दबदबे और शक्ति की चर्चा होती थी। झुण्ड में सब उसके आदेश का पालन करते थे, मजाल नहीं थी कि किसी का सर उसके सामने उठ जाये। नाम और मुकाम दोनों हासिल और जलवा भी कायम।

कोई बीस पच्चीस बरस बाद वही हाथी अपने झुण्ड के साथ उसी आश्रम के पास से गुज़र रहा था। नज़र पड़ी आश्रम पर तो कुछ कुछ याद आया ..... अन्दर प्रवेश किया तो गुरु के दर्शन होते ही भाव विभोर ....आयु, ख्याति,जलवा, ताकत, बुलंदी सब कुछ भूल कर नज़र सिर्फ गुरु के चरणों पर, जैसे बचपन फिर लौट आया ..... गुरु भी पहचान गए, गुरु की आँखों में आंसू छलक आये, भावनाओं के अतिरेक ने पूरे आश्रम को घेर लिया। गुरु ने प्यार से हाथ फेरा, प्यार दुलार किया और लगा कि मन ही मन और आँखों ही आँखों में पिछले पच्चीस साल का इतिहास बाँट लिया गया हो।

गुरु से मिलने के पश्चात हाथी आश्रम के भीतर की ओर चल पड़ा .... घूमते घूमते सांझ ढल चुकी थी और हाथी तो अपने बचपन में लौट ही चुका था ... जैसे आश्रम की हर चीज़ और हर लम्हे को अपने सीने में एक बार फिर संजो लेना चाहता हो ..... इतने में उसकी निगाह उसी खूंटे पर पड़ी जहाँ वो बचपन में आकर खड़ा हो जाया करता था, शीश झुका कर .... खूंटे को देखकर हाथी एक दम भाव विभोर ... किन्कर्तव्य विमूढ़ ... सारा जलवा, शक्ति, बुलंदी भुलाकर,आँखों में आंसुओं का सैलाब लिए, आगे के दोनों पैरों को झुकाकर, एक बार फिर सम्पूर्ण समर्पण के साथ नतमस्तक।

दोस्तों,
9 November को हम लखनऊ में आपके साथी और वो बच्चे जो **GCA** में उसी नन्हे हाथी की तरह अपने गुरुओं से जीवन का अमूल्य पाठ और दर्शन सीख रहे हैं, प्रतीक्षारत रहेंगे ..... आपको भावनाओं के भंवर में डूबते हुए देखने को ।।

our very own lucknow...

Lucknow is a city synonymous with the Nawabi Culture and is known for its Adaband Tahzeeb. Lucknow is also associated with its traditional hospitality, leisurely moods of life, fabled edifices steeped in history, world-renowned cuisine and exquisite Sham-e-Awadh. Tremors of time have not affectedthe cultural heritage and traditions of Lucknow.

As the legend runs, the city of Lucknow was founded by Laxman, the younger brother of Lord Rama, and accordingly named Lakshmanpuri which, through the passage of time, became Lakhanpur and finally Lucknow. According to historians, it was occupied by Mahmud Ghazni and later by Humayun in 1526. During the reign of Akbar, Sheikh Abdul Rahim managed to have him appointed as the Jagirdar of Lakhanpur and its adjoining areas. The territory flourished during his and his ancestor's regime. Sheikh Abdul Rahim built the historic MachhiBhawan and five palaces for himself and his wives. These buildings of architectural beauty became extinct during the first war of independence of India and on these ruins today stands the ChhatrapatiShahujMaharaj Medical University (upgraded King George's Medical College.)

In 1722 the Persian adventurer Saadat Khan was appointed the Governor of Oudh. He met the resentment of the Sheikh Zadas,the descendant of Sheikh Abdul Rahim. However, with the help of a superbly trained army,Saadat Khan captured MacchiBhawan and was succeeded by the line of rulers known as Nawabs of Oudh. The royal emblem of fish was conferred on him by the Mughal Emperor, which has now become the official seal of U.P. State Government. Under the Nawabs, during eighteenth and nineteenth centuries, Lucknow flourished and acquired the glory, which permeates its surroundings and environment even today. However, the credit of building most of old Lucknow to its magnificent heights goes to the fourth Nawab Asaf-U Daula (1775-1797). During this period Nawab Asaf-Ud-Daula broke away from the declining Mughals in Delhi.

Nawab Asaf-Ud-Daula's successor Saadat Ali Khan continued the development of Lucknow. But Oudh gradually became part of East India Company's rapidly expanding empire In India. Through a treaty signed in 1801 he ceded to the company nearly half of its territory. On his son Ghazi UddinHaider (1814-1828) Lord Hastings conferred the title of King. In less than a century the sun of this kingdom set over the waters ofthe Gomti river when the last Oudh King Nawab Wajid All Shah lost his throne to the East India Company. The Nawab dynasty ended with the abdication of Wajid Ali Shah in 1856. The entire Nawab period was a period of cultural upsurge, refinement in the art of living, fascinating and aesthetic developments.

ARCHITECTURE | LUCKNOW

"muskuraiye janaab...aap lucknow me hain"

Added to its architectural beauty is, Lucknow's distinctive culture emerged which epitomizes a way of life in which love of flowers, of good food, charming poetry and skilled choice of words in extremely polite conversation have made Lucknow a composite of refinement, delicacies, tenderness and what not. In all probability it is this feeling that Russell, a London times correspondent, rightly reacted about Lucknow when he said 'Not Rome, not Athens, not Constantinople, not any city, I have ever seen appears to me so striking and beautiful as this, and the more I gaze the more its beauty grows upon me."

Lucknow's culture is fragrant with sublimity and natural instinct of peace. In the present time when violence and terrorism are raising their heads, the people of Lucknow are wedded to its legacy of brotherhood and follow the great principle of "live and let other live" with utmost goodwill and amicable relationship. Paan chewing, Kite flying and chess playing have been extensively prevalent during the Nawab's period which actually symbolized the simplicity of their mind and magnificence of the power of accommodation and adjustment.

Lucknow has ever since been a musically fertile soil and there is no aspect of Hindustani music which was not enriched and nurtured here. Some of the greatest exponents of the Khayal and Maestros of Sitar, Veena, Sarangi,Pakhawaj and Tabla lived here and enriched their respective arts. It is a matter of great pride that internationally renowned BirjuMaharaj, ShambhooMaharaj and LachhooMaharaj, the great exponents of Kathak dance, belong to this city. The age old arts and crafts of Lucknow embrace a wide variety of items such as chikan work, khas curtains, clay toys, embroidery meena, zari, kundanjewellery, kites, fabulous tazias and renowned perfumes. Chikan work of Lucknow is in great demand all over the world. Most of these crafts are in the hands of old families who need all incentives from the authorities. With the impact of moderm culture these crafts have struggled to coexist and thereby have kept intact the characteristics of old Lucknow.

It will be worth mentioning about the most renowned and popular variety of mangoes called Dussehri had Safeda of this City. These mangoes are being exported all over India and abroad. Muskmelons and Kakris' of Lucknow are also popular.

With the fast industrial and scientific development, modern Lucknow, the capital of Uttar Pradesh has grown into a crowded cosmopolitan city with remarkable diversity of cultures drawn from all corners of the country. Nevertheless the city still retains its old and distinct characteristic quality of spaciousness, leisureliness and sublime warmth. Quite a number of new buildings,complexes and Institutions have come up. However, the magnificence of the old architectural beauty presents a confluence of old and new in the city's everyday life. Some of the places of interest which attract the tourists are enumerated below:

THE GREAT BARAIMAMBARA

It was built by Nawab Asaf-Ud-Daula in 1784 to provide work to famine stricken population round the clock. It has a huge vaulted room, one of the largest roofed structures standing without the support of beams of pillars. An added attraction to the Imambara is its labyrinth (Bhoolbhulaiya), the acoustics of which are interesting.

ALAMGIRI MOSQUE

To the north of the Imambara stands this mosque on the top of a mount known as Lakshmantila. It was built during the reign of Aurangzeb. It has an outstanding symmetry.

SHAHNAJAF IMAMBARA

It stands to the west Sikanderbagh (National Botanical Garden). It is a solid masonry structure with a massive dome where its builder Ghazi-Ud-Din Haider (died inA.D. 1827) lies buried. It has cenotaphs of gold and silver. In 1857 this place was used against the British army.

ROOMI DARWAZA

It gives admission of the outer ward of great Imambara and its most-expressive example of Oudh architecture.

CHHATAR MANZIL
This was built by Ghazi-Ud-Din Haider. It gets its name from the gilt umbrella over its dome. Today it houses the Central Drug Research Institute.

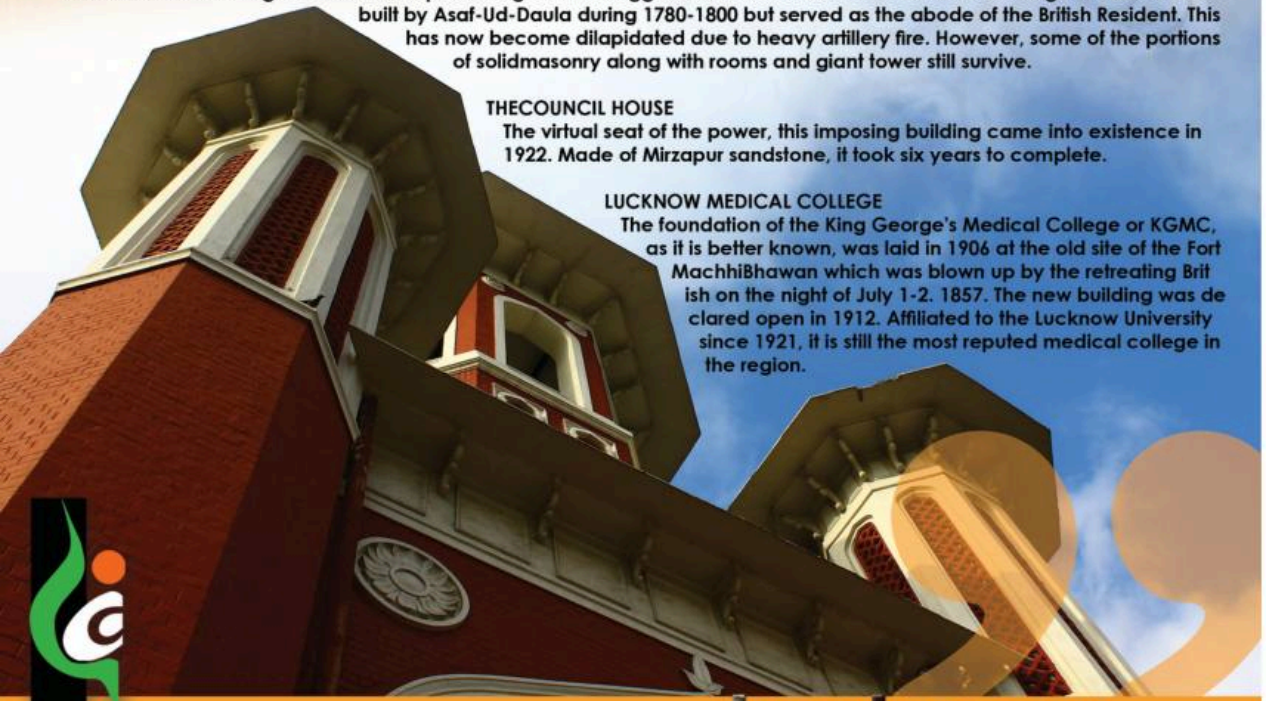

JAMA MASJID
A little distant from the great Imambaralies the Jama Masjid.

CHHOTAIMAMBARA
A short distance away to the west of RoomiDarwaza, set before a raised tank, amidst well laid out gardens and flanked by two replicas of the TajMahal stands the HussainabadImambara. It was built by Mohammad Ali Shah as a mausoleumfor himself.

THE RESIDENCY
This is the most striking historical site representing India's struggle for freedom. It was the center of the Siege in 1857. It was built by Asaf-Ud-Daula during 1780-1800 but served as the abode of the British Resident. This has now become dilapidated due to heavy artillery fire. However, some of the portions of solidmasonry along with rooms and giant tower still survive.

THECOUNCIL HOUSE
The virtual seat of the power, this imposing building came into existence in 1922. Made of Mirzapur sandstone, it took six years to complete.

LUCKNOW MEDICAL COLLEGE
The foundation of the King George's Medical College or KGMC, as it is better known, was laid in 1906 at the old site of the Fort MachhiBhawan which was blown up by the retreating Brit ish on the night of July 1-2. 1857. The new building was de clared open in 1912. Affiliated to the Lucknow University since 1921, it is still the most reputed medical college in the region.

ALUMNI ASSOCIATION
GOVERNMENT COLLEGE OF ARCHITECTURE | LUCKNOW

our very own lucknow...

LA MARTINIERE COLLEGE

It was built by French General Lord Claude Martin at the end of the 18th Century. The foundations of this imposing palace were laid on the raised ground adjoining the right bank of the Gomti river, on the outskirts of Lucknow. He was, however, not destined to use it as his residence. The final touches were being given to its exteriors when he passed away on September 13, 1800. In his will Martin expressed a desire to be buried here. He wanted the palace complex to serve as an exemplary educational institution. La Martiniere also holds the unique distinction of being the only college with battle honours won for the role played by 50 of its boys in holding of the Indian freedom fighters during the siege of the Residency.

THE LUCKNOW UNIVERSITY

The Lucknow University made a modest beginning in 1864 as the Canning HighSchool in a palace in Aminabad and shifted in 1866 to the Parikhana, one of the palaces of the Kaiserbagh Palace complex. In 1905 Canning College acquired 90 acres of land in what was then BadshahBagh on the other side of the river Gomti on which the grand University building was completed in 1911. The University was accorded independent status in 1922.

CHARBAGH RAILWAY STATION

The grandiose architecture of the Charbagh Railways Station at Lucknow enthralls any visitor. The new airport too has imitated its design. Built at a cost of Rs. 70 lakh, its foundation was laid by the Bishop of Lucknow in March 1914. The architect was J H Hornimen.

PARIS OF THE EAST

Elegant dressing has always had a special place in the Awadhi courts and large amounts were spent on attire and accessories by men and women alike. The last king of Awadh Wajid Ali Shah was easily pardoned for his artistic indulgences but drew criticism from all quarters when he tried to introduce a high court hat with a muslin veil-hanging down the back of the head, covering the nape. While the king called it AlamPasand (World's favourite) it was largely unpopular and drew flak from countries, bagging the nickname Jhoola (the swing) for the veil's tendency to sway!

Other places of importance are Lai Baradari, Clock Tower, Picture Gallery and DilkushaPalace. Besides these there are several gardens and parks. Some of the most beautiful parks have been recently developed by the Lucknow Development Authority. Buddha park, AmbedkarUdyan,Neebu Park and Hathi Park are some of them. It is on account of these parks that Lucknow is also known as the "City of Gardens".

Some of the places of interest which grew up during post Nawab period are General Post Office, Kukrael Picnic Spot,National Botanical Garden, Zoological Garden and Museum.

PAPERS

Conflict of benefits in Conservation
– The Heritage City of Lucknow

Excerpt from paper presented at ICOMOS Mexico, XXXIII International Symposium on Cultural Heritage, Coatepec, Veracruze, Mexico. October 1 - 4, 2013

Globalization or modernisation is the fastest economic and socio-cultural change. It has rapidly generated profound transformations. The change and homogenization is a constant: all cultural groups in the world have changed over time. While cultural change has always existed in the history of mankind both, invasions or external acquisitions, such as the colonization of the New World have accelerated them. But today, the rapid expansion of technology and its associated 'lifestyles', often called "Western" is prevailing. But we wonder how communities can carry their culture, their heritage-forward, while adopting some technological advantages, is the question. The advantages of some modernisation, expressions of economic 'arrival', can be a risk to built forms, ways of life and cultural expression to living heritage.

Carrying Capacity of Heritage City- the arrival of CONFLICTS

The great increase in number of visitors to any tourist place results in rapid unplanned construction of hotels and other buildings for use of tourists and for migratory service employees. This unplanned growth threatens to destroy the very environment which is tourist attraction. Attractions are the basic tourist resources and the main problem is developing a tourist area is how to exploit them to the full without damage. In this work for the Unite Nations in the Irish Republics, Michael Dower has developed the concept of the capacity of tourist resources. If the capacity is exceeded the result may be discomfort to the people using it or damage to the resources itself. The capacity of a resource, therefore, depends on the chosen objectives. If it is proposed to increase the capacity of a resource by investment when it is likely that there will be number of thresholds to cross, which require a large investment and hence a large ensuing development to obtain an adequate return. Thresholds are common in the increase of water supply or power and sewerage provision.

RUMI DARWAZA

ALUMNI ASSOCIATION
GOVERNMENT COLLEGE OF
ARCHITECTURE | LUCKNOW

In preparing a detailed plan for an action area it is important to estimate the capacity of all the facilities that visitors will use. The planners must consider the environment process wherever large investments are made in tourism development. Tourism development can become a positive factor for improving the environment, if certain amount of intelligent basic planning is done.

Globalization-a big threat to a sense of 'PLACE'

The reason – the conflicts

The planning, to bring into Metrorail as a faster means of transportation either underground to onground is a big threat to the city's heritage and its skyline..The emergence of Mall culture in and around the old city is again giving a new mixed dimensión to the cultural history of the city.The comingup of IT parks even at the outskirts have the impact on the residing population with the new migratory population.

The relationship between the heritage whether tangible or intangible with the sense of "Place" is complicated with these necessary yet harmful developments on the management and upkeep of these cultural elements, so important to keep them in original flavour, The language ,which is liked all over south Asia – "urdu imbibed hindi", with the famous tehzeeb of' "pehle aap" is about to vanish, with the advent of new linguistic habits of IT park youngsters and mixing with local residents.

The threat to the Crafts- International and internal- the conflicts of Benefits

This fine filigreed needlework worked upon gossamer muslin, crepes and chiffons, is supposed to have been brought from Persia by none other than the Empress Noorjehan herself. What makes chikankari such a distinctive needlecraft is that it is the only embroidery in the world which is so special in its discipline that each stitch is used only for one purpose. This art was limited to a fast depleting community of Chikankari artisans, mostly Muslims concentrated in muhallas of old Lucknow. Exploitation was rampant as the middlemen grabbed the profits, giving a pittance to the 'kaarigars'. Since the payment was per piece the workers would try and turn out as many as they could, greatly compromising the quality of work. A lot of fine traditional designs and stitches were being corrupted. From among 32 known stitches merely six were in common uses. The good artisans were abandoning the trade for more lucrative zardozi. Crude and substandard shadow work was sold even in Lucknow's posh market in the name of Chikan.

Young children were employed by these contractors, made to work ten to twelve hours and paid as little as five paise per piece. The living conditions were miserable and it was felt that the women were the worst sufferers but with the popularity and advent of international designers, the craft have been corrupted and mixed with other type of ornamentation which makes it loose its originality and purity from the genuine craft but for the economic upliftment of the artisans, it is a necessary nuisance which has to be taken care of very sensitively.

Based on the above, conservation becomes essential to incorporate the following-

- The character of the streetscape particularly Chowk (from Akbari Gate to Gol Darwaza), Aminabad, Kaiserbagh, Lalbagh and Hazratganj area be maintained. New buildings in the development process which are not in harmony to old ones should not be allowed.
- The monuments and buildings listed for conservation to be maintained. Alternative use of the buildings be thought without altering its exterior.

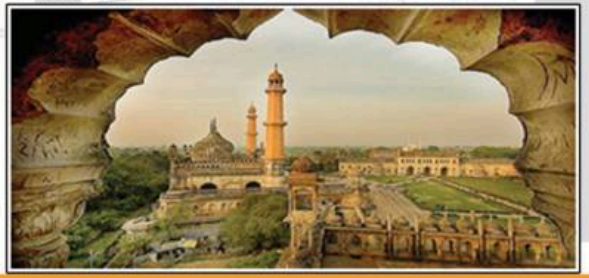

• The land use in the areas around monuments be specified to maintain its unified character.
The diversion of heavy traffic be given top priority wherever necessary to improve the circulation. The hoardings, electrical wires which deteriorate the aesthetical aspects be removed.

• The Building Byelaws should incorporate the area and height restrictions such that the visibility of the monuments is not obstructed.
Conservation of monuments and sites need be taken as integral part of the preparation and implementation of master plan of the city. Nature of restriction and development controls should also be included in such planning.
• The monuments and site, which are owned by private owners or trusts and are not maintained properly, be acquired otherwise owners or trusts should be subsidized so that these may be maintained properly.
• Research, documentation and study of such areas be taken up by identifying institutions and setting up cells of regional levels.

Proposals to make Lucknow a Tourist Hub

1.Inculcate a sense of pride among Lucknowites for the city. Revive the lost glory of heritage zones like Hazatratganj, Kaiserbagh, Hussainabad and La Martiniere.
2.Establish Lucknow Haat Arts & Crafts Bazaar with Awadhi food court and amphitheatres for live cultural performances. Here the people can taste the flavour of the famous music and dance of the city like kathak, thumri, and ghazals etc, This will not disturb the original flavour and ambience; instead will help in preserving the rich culture of Awadh.
3.The old buildings which can be used and are structurally safe should be readapted and reused in other forms, may be like living museum or public library or may be turned into performance venues with handicrafts and souvenirs shops inside them. Simulate Sham-e-Awadh experience with a cultural extravaganza from Awadh.
4.Establish Radio Taxi Service with meters and an efficient city bus service.
5.Create world class multisports stadium & convention center to attract tourists from these sectors.
6.Clean Gomti and encourage riverside tourism development.
7.Encourage bread-and-breakfast stay arrangements and heritage tourism in havelis and Kothis.
8.Develop small tourist circuits around Lucknow, involving places like Dewa Sharif & Kakori.
9.Make each monument more tourist-friendly with English-Speaking & well-trained guides & hygienic public conveniences & extend heritage walk to cover Kaiserbagh & Hussainabad.
10. Ensure an excellent web presence for Lucknow with lot of content creation for travel magazines, travel agents & holiday portals.

The dilemma of old City Square- the conflicts of old and new

Since its inception, this Central Square has been regarded as a unique centre of commerce, art and culture. If we talk about the Mughal architecture, the area was planned in a way that there were rows of double-storied structures on either side of the streets, with shops on the ground floor. Though the original style remains the same, but many of these structures have now been replaced with multi-storied buildings, resulting in a huge expansion. The idea of revamp has wide acceptance and willing from all quarters, especially the builders.

Residential demand is high mainly because the business communities with their shops in the same market want to live close-by, and secondly, the old denizens do not want to move out of their comfort zone as they identify themselves with the narrow lanes and mohalla culture.

The rates are sky high. The residential property is around Rs 4000/sq ft. Though, the commercial property rates have actually no limitation, but to get a fair idea, it is Rs 10,000/sq ft. Apart from congested surroundings, poor drainage system is a very important issue that must be taken up by the concerned authorities.

Chowk, once a plush green area has now been converted into a concrete jungle and therefore, it is essential that urgent measures are taken to re-organise the market, so that the traditional and historical relevance of the whole area can be restored for future. Public amenities like toilets and clean drinking water must be provided, especially for the women clients.

Tourism may be both a benefit to a local culture's living legacy or a risk: the current growth of cultural tourism around the world is massive, sometimes local but often overwhelmingly international. Opportunities for living heritage may be extra power to a community from income received into its space, risks are well known, including the potential to "freeze-frame" cultural expressions for the tourist market. The 'exotic' is an attraction for foreign tourists. A recurring example is that of some temples in Southeast Asia, inscribed on the World Heritage List, while temple dancers are cast out to perform in local hotels. A byproduct of foreign tourism is the appropriation of tradi-

tional practices by others, at times seen as cultural transfers, but sometimes as outright stealing. Intellectual copyright is an issue that involves living heritage and the rights of the relevant community to be acknowledged, and their right to decide the use of their living heritage.

Conclusion

We can conclude that it also means the exercise of rigid controls to prevent habitat destruction, habitat homogenization, reduction of species and natural resource pollution with the protection of our heritage whether tangible or intangible. Like any other city it is growing and evolving a new culture and a new life. To save old Lucknow, one has to allow a new Lucknow to grow. Economic forces have already overtaken the inherent cultural Nawabi ambience of this city. But this is a process of growth, a sign of change; an exhibition of vitality symbolic of the fact that Lucknow is not dying but is growing. But we have to ensure is a proper management of this transformation. Let a new Lucknow expand and prosper but let us preserve its cultural genesis for posterity by creating conditions for them to survive.

To identify the difficult but increasingly urgent task, in a changing world, to gather these two categories – tangible and intangible heritage, that are subject to three main threats: globalization, internal and external migration. The above issues for the sustainability of living, intangible heritage and its connection to place are ones that are worthy of discussion. For a balance between change and continuity is essential for the survival and sustainability of living heritage, both in its original space, and its possibilities to continue to live elsewhere.

Vipul B.Varshney is Visiting Faculty, A. A. ACHIEVING EXCELLENCE IN ARCHITECTURAL EDUCATION

-Prof. (Dr.) Ajay Khare,
Director, School of Planning and Architecture, Bhopal

Background:

Globalization and fallout from globalization on domestic issues in any country has changed the life of architects, architectural educators and allied professionals. But in countries like India, this is also a fact that we live in an unequal world. Architecture in India is practiced in a field that is not level, a field where the practitioners do not have equal means at their disposal – neither comparable education nor comparable technology. This is evident in the fact that more than eighty percent of Indian architects are based in eight larger towns of country despite of their requirement in other six hundred urban areas. The task of rendering the practice of architecture more equitable is not an easy one. In the long term, it is only education, and rather only quality education that can rectify the imbalance. For this to become reality, we need an education system that will ensure equal opportunities for all and a validation system that will reflect the merit of each and every programme being offered in all parts of the country.

In India, the professional education of architecture is imparted by more than 300 institutions in a five-year degree programme called 'Bachelor of Architecture'. Like any other technical education, architectural education is also regulated by All India Council of Technical Education (AICTE) through its boards and instruments. All India Board for Architectural Education, a board of AICTE, looks after the recognised architectural programmes in various universities, engineering colleges and in stand-alone colleges. National Board of Accreditation (NBA) is an autonomous board of MHRD, Government of India and aims to provide accreditation of architecture programmes in India to achieve quality across the country. So far, National Board of Accreditation has not met with much success as far as accreditation of Architecture Programmes is concerned.

Apart from All India Council of Technical Education and National Board of Accreditation, there are two other players associated with the field of architecture namely the Council of Architecture (CoA) and Indian Institute of Architects (IIA). Council of Architecture is a statutory body entrusted with registration of architects to let them practice throughout the country as architects. Indian Institute of Architects is a body corporate of architects working in India and this society looks after the interest of architecture profession and education.

International Scenario:

Indian Institute of Architects was initially founded in British India as part of Royal Institute of British Architects and now is a member of Commonwealth Association of Architects (CAA) and International Union of Architects (UIA). For the benefit of Indian Architects, any member who is associated with Indian Institute of Architects gets automatic association with Commonwealth Association of Architects and International Union of Architects.

International Union of Architects (UIA) was founded in 1948 and since then, it has been their endeavor to pursue maintenance of high standards in architectural education. In 1996, after a lot of discussion with experts from all over the world, a charter was drafted by UIA. This charter received great support from UNESCO and is known as UNESCO–UIA Charter of Architectural Education. Professor Balakrishna V Doshi, a renowned architect and educationist from India was part of the drafting committee of this UNESCO–UIA charter. After wide deliberations with validation committee members of UIA and after development of different validation systems all over the world, the revised version of this charter came up in 2005. Almost at the same time, Royal Institute of British Architects (RIBA) and Commonwealth Association of Architects (CAA) developed their validation systems for international architectural programmes. Meanwhile, National Architectural Accrediting Board (NAAB) in the United States of America also developed conditions for substantial equivalency for international programmes and revised them in 2009. In a major step to achieve substantial equivalency between accreditation / validation system in architectural education, eight major players of world joined hands to sign Canberra Accord in 2008 for mutual recognition of validation systems. These included NAAB, CAA, RIBA, and accrediting agencies of Australia, China, Canada, Korea and Mexico. The accord welcomes other accrediting agencies to join the group.

Indian Scenario:

Now we need to see where India stands in the middle of a globalized world with no international validation for its architectural programmes. In fact, international validation is possible only when we start thinking about accreditation within our country by our national board but here this paper is sincerely hoping that NBA will take decisive steps to launch the national accreditation in a bigger way as early as possible so that the steps towards international validation of our accreditation process can be taken. Washington Accord has given a great opportunity for engineering education to achieve international standards and probably, internationally, architectural education in 2013 is standing at a phase of initial expansion, what was happening with Washington accord in 1995 to 2000. Today this opportunity is there in form of Canberra Accord of which CAA is also a signatory.

Today, architectural education in India is at cross roads to take major leap forward. After 60s and 70s, formal architectural education started finding its own roots and rediscovery of Indian culture in architectural education led to development of Indian architecture with many great examples. Apart from ability to create architectural design with aesthetic and technical requirements, Indian architects were trained to have adequate knowledge of the histories and theories of architecture and the related arts and human sciences. The role of architects in society was also understood by the programmes in a better way. The five year degree programme in architecture generally remained of good standard, equivalent to RIBA part one and two, but formal validation or accreditation remained a non-starter. Only four programmes offered in colleges established by private sector have ever been validated by international validation (CAA).

Some architecture programmes fully supported by central government emphasize on following perspectives - Academic context, students registration, profession and society. The programmes respect diversity of the country and providing education to all citizens including affirmative action for the deprived classes. These programmes such as one offered at School of Planning and Architecture reflect a studio culture respectful of learning environment through the encouragement of fundamental values of enquiry, optimism, respect, engagement and innovation between and among the members of its faculty, student body and administration. This is firm belief of the author that out of 300 institutions, in our country many of them will easily qualify for international validation. Here, the fact remains that out of three hundred thousand Indian students presently going abroad for higher studies in one academic year, approximately ten percent of them are architecture graduates of our country. These students will face tremendous difficulties if they are keen about getting license or getting permission of practice in those countries unless their programmes of study in India are validated by international agencies.

We all understand the values of internationalization of architectural education but would always say no to globalization of culture, hence refuse globalization of architecture education. But the diversity should be harnessed in a way that will allow for portability of academic credentials at both the international and regional levels. This is particularly more important when we envisage a world that will be characterized by a far greater mobility of architects and also of students. So we must think about devising something which will ensure portability not only of the final degree but also of some annual programmes such as studying abroad semesters, facilitating exchange for students and for architects.

The Opportunity:

Today following accords / systems present us with an opportunity to achieve international validation of our architecture programmes:

1.Canberra Accord on Architectural Education signed in 2008.
2.RIBA procedures for validation for international programmes revised in 2011.
3.UNESCO–UIA validation system for architectural education adopted in 2002 and revised in 2007.
4.Conditions of substantial equivalency proposed by National Architectural Accrediting Board (NAAB), United States of America released in 2009.
5.'Green Book' produced by Commonwealth Association of Architects (CAA) in December, 2007 for validation of Architecture Programs.

All above documents emphasize on core principles of UNESCO–UIA charter for architectural education revised in 2005 and advocate for following special points to be considered in the curriculum of architectural education:

a. Awareness of responsibilities towards human, social, cultural, urban, architectural and environmental values as well as architectural heritage.
b. Adequate knowledge of the means of achieving ecological, sustainable design and environmental conservation and rehabilitation.
c. Development of a creative competence in building techniques founded on a comprehensive understanding of the disciplines and construction methods related to architecture.

d. Adequate knowledge of project financing, project management, cost control & methods of project delivery.
e. Training in research techniques as an inherent part of architectural learning for both students and teachers.

The UNESCO-UIA charter recognizes architecture as a discipline, which draws knowledge from the humanities, the social and the physical sciences, technology, environmental sciences, the creative arts and the liberal arts. The author with his experience of working in many good architecture institutions in our country can state that many of our institutions are following this international charter in letter and spirit. School of Planning and Architecture, Bhopal founded in 2008 mentions in its own mission that "a sense of enquiry must prevail amongst all its stakeholders and enquiry should become method of design" thus emphasizing research as an inherent part of architectural teaching and learning.

Path Ahead:

Canberra Accord and UNESCO-UIA charter today present a unique opportunity for us to get into international validation systems and gain substantial equivalency for our accreditation system / recognition of our Architecture degree programmmes almost throughout the world. It can happen only when we develop our own accreditation system of architecture programmes under National Board of Accreditation, spread across the country. It is important to notice that, for any National board or agency of accreditation to be recognized by UIA, Commonwealth Association of Architects (CAA) or by member nations of the Canberra Accord, any national board or agency has to present minimum three case studies. As we all know that Government of India is very keen to develop School of Planning and Architecture (SPA) system like Indian Institute of Management (IIM) or Indian Institute of Technology (IIT) system. In this process, Ministry of Human Resource Development, Government of India has founded two schools of planning architecture in 2008 at Bhopal and Vijaywada and planned for two new schools in next five-year plan. These specialized university level national institutions along with 50 year old School of Planning and Architecture, New Delhi can become case studies to be presented for international validations. The group can be enlarged by inclusion of two programmes being offered at Indian Institute of Technology at Kharagpur and Roorkee. Once the accreditation system is established and verified by a process of collaborative and comparative analysis, the best programmes of our country will gain substantial equivalency between the best programmes of any universities in the world.

As signatory of above accords each country has obligation to make reasonable efforts to ensure that the bodies responsible for the registration / licensure of architects to practice in its territory or country will recognize the substantial equivalency of both the accreditation validation systems and academic qualification accredited / validated by signatories. UIA Accord on International standards of professionalism in architectural practice recommends vital policy issues about registration / licensing / certification and practice in other countries. But, here also, accreditation and validation systems and substantial equivalency takes precedence over any other policy issue Intellectual empowerment of any minds should be the primary aim of every school of architecture, as today, a strong social engagement is demanded of an architect, a more extensive role is expected in society and in fields that are outside the realms of the profession. To achieve a level playing field for the architects of the nation we have to have a strong accreditation system with substantial equivalency with international systems so that all schools would like to achieve the required standards to handle the complex development problems. This is the opportune time for architectural education when it is bound to grow extensively commensurate for the sustained growth of the nation.

The author would like to thankfully acknowledge the use of following documents for above paper:

1.Canberra Accord on Architectural Education signed in 2008 Canberra Secretariat http://www.canberraaccord.org/home.aspx.
2.RIBA procedures for validation and validation criteria for UK and international courses and examinations in architecture, http://www.architecture.com/Files/RIBAProfessionalServices/Education/Validation/ValidationProcedures2011.pdf
3.UNESCO – UIA VALIDATION SYSTEM FOR ARCHITECTURAL EDUCATION adopted in 2002 http://www.sadas-pea.gr/old/35795%20D.pdf
4.2009 Conditions of substantial equivalency proposed by National Architectural Accrediting Board – USA, For Professional Degree Programs in Architecture http://www.naab.org/accreditation/2009_Conditions.aspx
5.Green Book produced by Commonwealth Architects Association in December, 2007, http://www.comarchitect.org/pdfs/valgreenbkprocedures.pdf

Author' Introduction:

Prof. (Dr.) Ajay Khare, Founder-Director of SPA Bhopal is a well-known scholar in the field of Architecture and remained a Fulbright Fellow at USA and Charles Wallace Fellow at UK. Prof. Ajay Khare earned his doctorate from De Montfort University, Leicester, UK, on his work about early temples of eastern India. An architect and conservationist, educated at GCA, Lucknow and SPA, Delhi, Prof. Khare studied heritage conservation at York University. He is author of a widely acclaimed book 'Temple Architecture of Eastern India' published in 2005. He received prestigious National ArchiDesign award for best-written work in Architecture for this book. He has edited many conference proceedings and written several articles, research papers and book reviews in national and international journals. He edits international journal called 'SPANDREL' as Chief Editor and was the founder-editor of 'ABACUS'. Prof. Khare serves on many National committees and Missions including member of Planning commission working group on Technical education for twelfth plan and represented the country in first ever Indo-US Higher Education Summit at Washington in 2011. He is Fellow of Indian Institute of Architects and member of the General Council of National Board of Accreditation, India.

Havelis of Shekhawati: A Case for Participatory Approach to Heritage Management

Urvashi Srivastava, Conservation Architect

Abstract

Nestled in the semi desert part of Rajasthan, are several towns that constitute the mesmerising region of Shekhawati. The region has the largest concentration of painted structures anywhere in the world and is referred to as an open-air art gallery. Several towns in the region have a rare profusion of finely executed frescoes across hundreds of beautiful buildings especially havelis. However this diverse built heritage is crumbling fast. Havelis now stand abandoned, neglected and abused. Innumerable risk factors have been responsible for their deterioration. In the midst of these challenging circumstances the big question that arises is what can be done to save these priceless buildings.

Full Paper

Shekhawati a region characterized by vast tracts of sand dunes and sparse vegetation faces an acute summer and winter season with scant rainfall. In spite of inclement conditions that make the region almost inhospitable, several towns and innumerable villages have not only developed throughout this semi desert tract but have also sustained a unique cultural environment. Different traditional buildings and associated spaces that came into existence in the heart of this desert land constitute its rich built heritage.

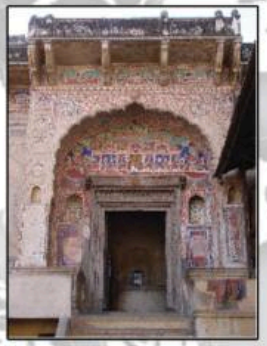

Shekhawati, one of the richest artistic and architectural regions of India is renowned across the world for beautiful mural paintings that adorn the surfaces of innumerable traditional buildings. This enchanting and mesmerising colourful region in Rajasthan has the largest concentration of painted structures anywhere in the world being spread over three districts of Jhunjhunu, Sikar and Churu in Rajasthan (covering approx. 30,000 sq km area). The towns in the region are like an open-air art gallery with several of them having a rare profusion of finely executed frescoes across innumerable buildings.

Amongst the hundreds of beautiful structures such as temples, cenotaphs, shops, sarais, wells and tanks that dot the region, havelis stand out as a distinct and dominating built form and are unique. Havelis or mansions define the domestic space of the inhabitants and their planning,

ALUMNI ASSOCIATION

ARCHITECTURE | LUCKNOW

, design and construction demonstrates a deep understanding of structural laws, local building materials, climatic conditions, topography, culture and way of life. By a rough estimate there are around 5000 havelis in the region.

Amongst all traditional building types in Shekhawati, havelis epitomize the ingenuity and artistic temperament of both the owners and the craftsmen. A wide variety of building materials, construction techniques and skills have been used to create spaces in the haveli. Local building materials have been adapted and improvised to achieve best quality in construction within limited resources. Apart from functional and structural aspects of construction that have been very skillfully achieved in a haveli, aesthetic aspects have been equally exemplified. Locally available materials have been very adeptly transformed to create artistic enclosures for human activity that beautifully reflect the local culture. Several finishes and ornamentation techniques have been used to adorn the havelis. Mural paintings on lime plaster have been extensively used as an artistic medium for expression. Almost all the surfaces of the havelis have been painted with beautiful figures, intricate motifs, geometrical and floral patterns and borders. Every inch of space displays a mastery of the technique of mural painting. Apart from wall painting stucco, stone carving, wood carving, brass inlay work, coloured glass work, sculpture work, gold painting and mirror inlay work are some of the other ornamentation techniques that have been employed with utmost perfection in havelis. Beautifully painted havelis standing out in the monochrome topography of the region are the raison d^etre for Shekhawati being referred to as an 'open air art gallery'.

However over the years the rich built heritage of Shekhawati has undergone transformation and has been considerably impacted by urbanization. The existing stock of havelis in the region is also steadily getting transformed. Since the construction of the majority of painted havelis was patronized by influential Marwari merchants, today in their absence the havelis are in a derelict state. Majority of the owners of havelis no longer stay in them. Most of them and their heirs have settled far away in metropolitan cities. A significant number of havelis are locked. Several of the havelis are in possession of caretakers and tenants, who neither have any emotional bonding nor have the requisite technical know how and financial means to take care of them. In addition over the years as per the Marwari tradition of dividing the property equally amongst the surviving sons, most of the havelis have multiple owners. Some of the havelis have as many as 15-30 owners laying their stake on the property. With lack of consensus amongst the owners such disputed havelis remain permanently locked.

In the absence of maintenance and repair work locked havelis are languishing. These buildings are in a complete state of disrepair. Unchecked vegetation growth inside the courts as well as on the structure has lead to major structural damages. Rising dampness has slowly eaten away the wall plasters and precious murals are steadily

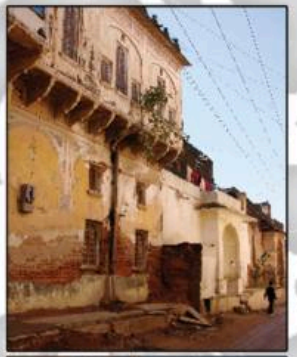

getting destroyed. Wooden architectural elements such as beautifully carved ornamental doors, windows and beams have decayed as a result of unchecked termite attack. Lack of adequate watch and ward has lead to several incidences of theft of precious wooden architectural elements that are sold in the antique markets for hefty sums. In the absence of any initiative from the owners and caretakers these havelis are in a severely damaged state. Divided inheritance has resulted into little interest in the fate of the family mansion apart from veto power which has accentuated, with the influx of foreign tourists, into an innate temptation to wait and watch the rise in real estate prices for selling off the haveli.

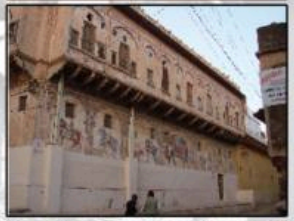

The status of havelis that are in use is equally bad. Some of the multiple owner havelis have been subdivided and have been leased out to multiple tenants resulting in loss of integrity of the structure raising serious issues of maintenance. Insensitive retrofitting of havelis for contemporary needs is a significant threat. Modern infrastructure mindlessly inserted in havelis has damaged beautifully painted surfaces.

Deterioration of havelis has been further aggravated by insensitive use of spaces. Unused spaces in several havelis have been insensitively converted into shops. Inadequate construction, addition of new floors and renovation of havelis has damaged their distinct architectural character.

Many of the havelis have been seriously damaged due to lack of adequate knowledge of repair and maintenance of traditional construction and use of traditional materials. Unplanned and insensitive repair and maintenance works have intensified the problem. Unaware residents trust spurious techniques and quick fix solutions for repair works that are detrimental to the structure. Facades of havelis have often been white washed and painted with synthetic paints causing irreparable damage to the precious paintings. Use of modern materials especially cement for repair has caused serious damage to the masonry. Fake techniques being used to retouch and decorate architectural surfaces are damaging the original mural paintings.

Public apathy and insensitivity towards the preservation of havelis is another cause for serious concern. Many havelis are deliberately not being maintained so that they can be declared unsafe and can be easily demolished to make land available for new construction. Flourishing antique trade in the region is a major threat to the existence of havelis. Salvaged architectural components of the havelis like ornamentally carved wooden doors, windows, jharokhas, beams, pillars, arches, brackets and furniture items are being sold in the antique market flourishing in the region. Advertisements ruthlessly painted on the

façade of the havelis have disfigured the murals. Indiscriminate pasting of posters, writing of social and political messages and casual graffiti have damaged the beautifully painted walls of the havelis.

Surge in tourism activity in the region is posing further problems. Havelis have become new attractions for tourists, increasingly becoming part of the well-established tourism industry of Rajasthan and empty havelis are being appropriated by increased tourism activity in the region triggering their conversion into heritage hotels. Quite a few havelis have been converted into hotels unfortunately without paying adequate attention to their authentic character, significance and traditional construction technology. The new tourism entrepreneurs are oblivious of the damage that they are causing to beautiful havelis.

Painted havelis are unprotected structures, are privately owned and therefore out of the purview of direct government intervention as far as their preservation, repair and maintenance is concerned. There are no protection laws and regulations for heritage buildings in Shekhawati. Therefore there is no deterrent to stop havelis from being demolished, renovated and significantly transformed. In the absence of a legislative framework for safeguarding and protection of heritage assets, havelis in Shekhawati are at serious risk.

Shekhawati havelis without their true patrons are facing their fateful destiny. Majority of the owners and occupants are not interested in conserving these structures nor do they have the necessary technical means to do so. It is ironical that many of the Marwari merchant families, original owners of these havelis and patrons of yester years today own big business houses acclaimed both nationally and internationally. Their mansions however languish and their upkeep staff linger-on in the hope that someday either the owners would relent and preserve in order to revive life within them or the government would come forward to conserve the building for them as also for the visitors.

Shekhawati havelis are an ideal case highlighting the much neglected social dimension of conservation and the significance of a preventive approach. It is imperative to formulate a well planned strategy for conservation of Shekhawati havelis that involves all the stakeholders and addresses their differing needs. Also it is time to explore alternative methods of preservation in place of the conventional one time project based capital intensive approach. Timely interventions can minimize damage and preventive measures can save this unique and significant heritage resource from getting obliterated and at the same time do away with the need for expensive restoration projects. A holistic preventive conservation and management based strategy has a lot of potential and a participatory approach seems to be the only means to conserve these beautiful structures for posterity.

Havelis can be meaningfully conserved with the active support and participation of all the stakeholders viz. State and Central Government, local civic bodies, owners, caretakers, tenants, local craftsmen and visitors. There is an urgent need for forging partnerships between local people and urban local bodies at all levels of policy and intervention. Public participation is crucial for undertaking a lot of preventive preservation activities that can ensure effective utilisation of limited financial resources available for conservation works. A well planned Owners/Caretakers program for awareness generation with regards sensitive use, adaptive reuse, adequate retrofitting, and efficacy of periodic monitoring, repair and maintenance would be extremely helpful in involving the local people in conservation, management and development of havelis. A periodic monitoring, diagnosis and repair system supported and adopted by haveli owners would ensure the preservation of locked and unused havelis.

Active involvement of the local community in tourism development would help promote responsible cultural tourism in the region. Local people could be persuaded to sensitively reuse their havelis and willing owners could be facilitated to develop their havelis as home stays. Local building craftsmen could be encouraged and supported to hone their traditional skills as the knowledge of local building crafts plays a vital role in ensuring authentic repair and maintenance works.

All these interventions require a close collaboration between various stake holders. There is therefore an urgent need to build new partnerships and evolve an ecology of new enterprise in the region. Owners and caretakers of havelis need to be encouraged to become custodians of heritage rather than being mere onlookers, civic agencies need to evolve into managers from being mere administrators, visitors need to act as new responsible patrons rather than just being tourists and craftsmen need to be encouraged to become entrepreneurs for ensuring revival and sustenance of traditional building crafts. Successful partnerships with local communities can go a long way in helping preserve the rich cultural legacy of Shekhawati.

VERNACULAR HOUSES AT LUCKNOW:
Thermal & Visual Comfort Within

- Ritu Gulati

Vernacular houses have sustained over generations having added or deducted the non-useful. Various aspects of Comfort include thermal and visual comfort. Vernacular houses can be called comfortable as they have adapted to specific places and user groups. Mud houses located on the fringes of Lucknow City and the downtown city houses at Farangi Mahal in Chowk area are two types of vernacular houses that have existed simultaneously for hundreds of years. .Both have subsisted in diverse contexts, have been made of varying materials and techniques and house different communities with altered activity patterns and social structure. Yet both could be called comfortable and sustainable in the real sense of the word.

Keywords: Comfort; Lucknow; Sustainable; Vernacular

Introduction:

In this age of globalization, Sustainability can be best understood by the Vernacular Architecture of a place, which has sustained for generations with modifications and improvisations keeping it in tune with time. vernacular architecture all over the world has been examined for historical/ archaeological, anthropological, geographical and romantic aspects to derive clues from the ways these civilizations existed. Though 'more interpretative is the work of architects who seek to recreate the qualities of vernacular traditions without imitating them.....for them, the vernacular is the source of inspiration''.

The vernacular houses are the best examples of tracing the evolution of civilizations. There might have been many factors contributing to the way these houses evolved, from social, economic, climatic, cultural and even religious. The vernacular houses which have been built after centuries of development, checks and balances and successive minor adjustments can be called 'comfortable'.

Aspects Of Comfort:

The concept of comfort has many ramifications, both physiological and psychological. Within a built environment a person's comfort may consist of thermal, visual, aural and psychological comfort conditions. Most studies indicate that, to the occupants, the most important consideration in a built space is thermal comfort. Thermal comfort has been defined by ASHRAE as that state of mind which expresses satisfaction with the thermal environment. Scientists investigating thermal comfort have treated the human organism as a meter of thermal comfort. The ASHRAE describes the state of thermal comfort as neutral on a scale ranging from hot to cold.

There have been various studies that attempt to derive the set of conditions of temperature, humidity and air speed that correspond most closely to this neutral feeling and how tolerant people are of deviations from it. The human meter was studied in a climate chamber where subjective variables are left outside. With results of climate chamber experiments the environmental scientists devised formulas in which neutral conditions could be predicted. Fanger[2] also developed the predicted mean vote (PMV) to set optimum indoor conditions by setting them to achieve a PMV of neutral.

This static model of comfort had its limitations though. Firstly it was difficult to predict what the metabolic heat of the average occupant of a building would be. Secondly for predicting the PMV the clothing people w ere wearing had to be predicted which was complicated and thirdly as the peoples' expectations of their environment and their reactions are formed by their experience, their reaction to the environment could not be solely explained by its present state. Thus the climate chamber approach did give the neutral temperature but that was applicable only for steady state conditions which were based on assumptions of clothing and activity which could not be predicted.

Another approach to study thermal comfort was that of the field study approach which also has been used for years. In this case people were again used as comfort meters but were left on their own to carry on their lives in their normal surroundings. The physical conditions that they experienced- temperature, humidity and air movement were also measured in the same way. The tropical summer index (TSI) developed by Sharma and Ali[3] is a good example of the result of a field survey. They established the formulae for (TSI= ¾ Tg + Tw -2v) where Tg = globe temperature, Tw = wet bulb temperature and v = air velocity. They found that the greatest number of people were comfortable when the TSI was 27.5°C.

There were limitations to these type of surveys also because the conditions the subjects experienced could not be controlled, the range of temperatures which they applied on might be restricted, the relationship between the physical environment and the subjective comfort was blurred by time related factors and the fact that the subjects could change posture clothing etc.and these made the results difficult to interpret.

This field survey established the 'adaptive model' of thermal comfort which meant that we adapt in the short term by our actions and in the long term through our culture to the pressure of our environment. The approach using the adaptive model of thermal comfort was to relate thermal comfort indoors to the conditions prevailing outdoors. This theory found its bearings in the fact that most buildings in hot climates are naturally ventilated and the indoor temperature is related to the outdoor temperature. According to the theory of adaptive model of thermal comfort we adapt ourselves at the byaverage temperature we encounter. In other words we would be comfortable at the average indoor temperature. So the comfort temperature is related

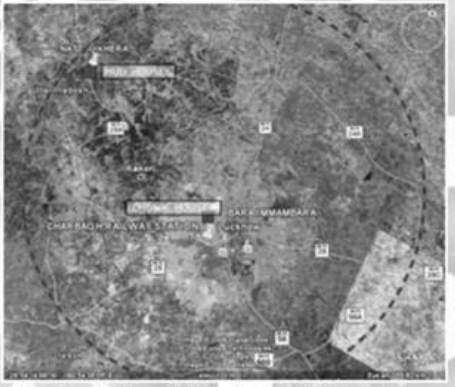

Fig.1 Location Of Two Types Of Vernacular Houses At Lucknow.

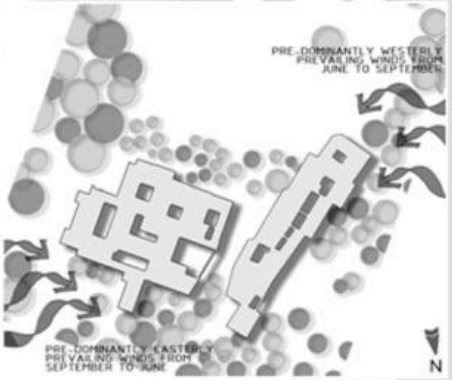

Fig.2. Mud Houses On The Fringes Of The City: Showing Siting & Location.
Source:http://www.mapsofindia.com/maps/utarpradesh/ Lucknow. Developed by the author

to the indoor temperature which is related to the outdoor temperature. So in our quest for the comfortable indoor temperature which is sensitive to the changes from climate to climate and from season to season, the average outdoor temperature is a good measure.

Humphreys4 was the first one to show the strength of the relationship between outdoor temperature and the comfort temperature indoors particularly for naturally ventilated buildings. He collected the results from comfort surveys throughout the world and plotted the temperature which the surveys reported as comfortable against the outdoor temperature for the month of the surveys. He established the equation of (Tc = 12.1 + 0.53 To) where Tc was the comfort temperature and To was the outdoor temperature. Recent work by Nicol et al.5 in the sub-continent has demonstrated the same effect in a climate similar to that in India. His equation (Tc = 17.0 + 0.38 To) gave a similar effect as that of Humphreys especially in the summer months. In concurrence to the theory of adaptive model of comfort Nicol et al. have plotted relationship of outdoor temperature, indoor temperature and comfort temperature for four different climatic conditions that existed in the subcontinent6 that negate the theory of neutral temperature and also the static model of thermal comfort.Conclusively, the factors that contribute to the thermal comfort conditions of a built form comprise of siting, orientation, layout, shape, form, materials of enclosing surfaces, and the location, position and orientation of fenestrations.

In addition to thermal comfort the second most important aspect inducing comfort conditions in a built space is that of visual comfort. Visual comfort is a state of consciousness evolved as a result of physiological and psychological effects. It expresses satisfaction with the visible environment and is defined by illumination and aesthetic environment.

Though in addition to thermal comfort, design in relation to climate is also concerned with lighting and visual comfort'6, there have been relatively fewer studies on the analysis of visual comfort of buildings, and most of them have been directed at assessing the visual performance than their visual comfort and aesthetic satisfaction. The notion of visual performance would concern the amount of light available for a given task whereas visual comfort and aesthetic satisfaction would depend on the way the light illuminates the surfaces and environment with the aspects of spatial distribution of daylight illuminance, luminance ratios, shape from shadows, color rendering, glare and visual noise.

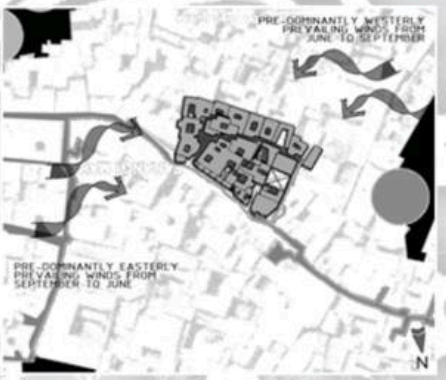

Fig.3.Houses At Farangi Mahal: Siting &Location Source:http://www.mapsofindia.com/maps/uttarpradesh/ Lucknow.developed by the author

Fig:4. VERNACULAR MUD HOUSES
Source: author

The most controllable causes influencing the quality and quantity of daylight within a room, for a specific building type are: the envelope shape, the geometry, location and orientation of apertures and the surface characteristics. And for understanding visual comfort one should understand notions of spatial distribution of daylight illuminance, luminance ratios, shape from shadows, color rendering, glare and visual noise.7

Vernacular Houses Of Lucknow

Lucknow is a densely populated city with a thickly knit fabric consisting broadly of three types of vernacular houses. On the fringes of the city the mud houses are found in clusters forming semi-urban settlements. These have evolved over generations of living. These mud houses built with rammed earth combined with thatch and other indigenous materials have a similar typology and are distributed evenly along the Gangetic plains.

The houses in the old city area of Lucknow are a mixture of old and new walls, jammed together covering a large area. The city houses of the Farangi Mahal area in Chowk, made of lakhori bricks and lime mortar with wooden spars and stone were built by French cloth merchants in the early seventeenth century. They are historically important, have similar generic type and have been least altered from their original contexts There are variations in these houses but the basic pattern remains remarkably consistent.

Comfort In Vernacular Houses at Lucknow

The two types of houses located in dissimilar contexts within city limits seem to exhibit simultaneous thermal and visual comfort. Since solar radiation is the source of both light and heat its influence on the conditions of both thermal and visual comfort could be co-related. Moreover India having tropical climate and Lucknow being located in the Gangetic plains it experiences a composite climate. The seasons change from Hot And Dry between March To May to Warm And Humid between June and September and cold and wet from November To January through the year. The changing position of sun through the day and all through the year results in changing thermal and visual conditions yet it is remarkable to visualize the internal spaces of the houses both thermally and visually comfortable.

Evolution of society & culture in vernacular houses at lucknow.

The mud houses situated on the fringes of the city forming semi-urban settlements have been occupied by families largely engaged in farming besides other occupations. Predominantly habited by Hindu population the generic mud house form consists of an aangan (courtyard) or a series of hierarchical courts enveloped by kamras (rooms) of various sizes separated by the dalaan (verandah). The chowka (kitchen) is an space within the dalaan separated by a short wall. The external dalaan (verandah) becomes an effective transition from the outside to inside or the public and private. The windows are small and limited opening to the verandahs either facing outside or the internal courtyard.

Subsequent to the analysis of activity patterns in these mud houses all through the day in varying seasons throughout the year, the verandahs and courtyards remain the most inhabited areas despite a great deal of shifting from the innermost areas to the outermost. These might have resulted from the informal living patterns of the occupants while the simultaneous response of the aforementioned spaces to the climate also made them comfortable. Moreover complying with the concept of adaptive comfort the occupants have made these houses comfortable for themselves and vice-versa by adding layers of usage over generations of living. Consequently these houses have retained their generic form over years with additions to it in form of partitions, divisions, overhangs etc.

Although Lucknow, has always had a larger Hindu population than the Muslims, the Muslim influence has been disproportionately large and it is difficult to differentiate between Hindu and Muslim house type. The city houses of Farangi Mahal are a characteristic example of the same. A typical house consists of two courtyards side by side. The larger one, the mardana or men's quarter, opens onto the street through a narrow gateway and the zenana or women's quarter can only be entered from the men's courtyard. Around each side of both courtyards are rooms, often with a small verandah that helps to shade the rooms from the sun and allows the inhabitants to enjoy the open air while being partially protected by the verandah roof. The rooms round the courtyards seldom have any windows in the far walls other than small high grills for ventilation, and it is unusual to find interconnecting doors between the rooms except in larger and grander houses. Of course, there are variations, depending upon the inclination and, more important, the purse of the owner, but the basic pattern remains remarkably consistent.

The sequence of movement from the street to the private interior core of the dwelling is broken by the presence of a separate entry room8. The structural system of the dwelling constitutes timber joists resting on timber beams supported on the walls or the columns. The walls and the columns are made of Lakhori bricks and lime mortar which was locally manufactured.

The Farangi Mahal, as it exists today is a fantastic mixture of old and new walls, jammed together, covering a large area. A large central courtyard around which the pre-nawabi houses were placed is still discernible. The entrance to this quarter was from a secondary street and was marked by a large gateway. To the immediate right, upon entering the quarter is the main building which in the 18th century became the famous 'Farangi Mahal' Madrasa .It's configuration is similar to the Lucknow house type, infact most building types, but it differs in its scale, in that it is much larger. There is an indirect entry which leads into a central courtyard surrounded by four Iwans which lead off into rooms. The upper floor is accessible by a staircase leading off from the court and is essentially an open terrace, with rooms on only one side. There are also other courtyards with similar configurations, connected to the first. It is possible to discern European style of architecture, especially in the second courtyard. Essentially Farangi Mahal is an eclectic mix of architecture, styles, with layers having been added to it over time.

Sustainability has been about being able to keep something going over a long period of time. Vernacular houses are the best examples of the continuity of culture and tradition in a progressive society. They have been able to respond to the climate of a specific place besides taking the evolution of human civilization. The vernacular houses at lucknow are primarily of two types the semi rural mud houses housing the informal agrarian people on the fringes of the city and the downtown firangi mahal houses accommodating culture specific population for centuries. Both these vernacular houses exhibit a system of living that has transcended barriers of time. Despite not altering from their generic forms, layers of usage have made it suitable in their contemporary context also. Moreover their living spaces still respond to the extremities of the climatic conditions and flexible planning and adaptive comfort make them sustainable in every sense of the word.

UNIVERSAL DESIGN PRINCIPLES
taking India towards inclusion....

Rachna Khare, Professor and Associate Dean, School of Planning and Architecture, Bhopal

ABSTRACT: Universal design is a commitment to design for all people and it implies a belief that all people, regardless of their physical condition, can benefit from the same environment or product, if designed appropriately. This emerged from the international movement of 'Barrier Free Design', entrenched in providing specialized and separate designs for people with disabilities.This paper reports the development and evolution of five principles of Universal Design India (UDIP), which addresses the needs of diverse Indian users across ability, age, socio-economic strata and culture.

BACKGROUND: India has 2.19 crore persons with disabilities that constitute 2.13 per cent of its total population (Census India 2011) and one-third of the total world's disabled population. Moreover, the elderly population in the country is second largest in the world with high family dependency out of which half have at least one kind of disability (Kujur and Ekka, 2010). Other than people with disabilities and elderly there are small children, pregnant women and members with temporary and permanent ailments that are to be supported by families in India. Even after sixteen years of Persons with Disabilities (Equal Opportunities, Protection of Rights and Full Participation) Act, 1995, low literacy, few jobs and widespread social stigma are making disabled people amongst the most excluded in the country. Children with disabilities are less likely to be in school, disabled adults are more likely to be unemployed, disabled elderly are dependent on their caregivers, and families with a disabled member are often worse off than average (World Bank, 2007). With growing people's diversity, social exclusion as a phenomenon is also on the rise, through rich poor, urban rural, traditional modern, regional global divides, which calls for an urgent attention of the stakeholders in the process of steering nation towards the future (Mullick, 2011; Khare, 2011). Understanding their responsibility towards building an inclusive community, a set of architects, industrial designers, ergonomists and access consultant from prestigious academic institutions (like IITs, NID and SPA) and a few proactive NGOs in India have come together to make 'Five Universal Design India Principles' with strong Indian idiom to design inclusive products, environments and systems. These principles are contextual derivation of famous 'Seven Universal Design Principles' already established internationally, to help people with functional limitations and facilitate participation in community living across the spectrum of ability, age, socio-economic strata and culture.

UNIVERSAL DESIGN: Though the origin of Universal Design resides in the disability rights movement, it is not a synonym of Accessibility. Universal design involves a fundamental shift in thinking about design, particularly with regard to designing to address social difference. Developed in USA as a Civil Rights Issue and equal opportunity for those with and without disabilities, the democratic values of universal design are grounded in self reliance,

ALUMNI ASSOCIATION
GOVERNMENT COLLEGE OF ARCHITECTURE | LUCKNOW

social empowerment and personal choice. Universal design is based on the premise that buildings and products must be designed to be usable by all intended users and offer greater independence, safety and usability by everyone (Steinfeld and Mullick 1997; Story, 1998). As a design approach, universal design requires incorporating flexibility, adaptability and modularity to achieve best fit and mass customization for everyone. Example of universal design includes an office chair that through its many adjustments provide many opportunities for customization. At the Center for Universal Design at North Carolina State University a group of experts established seven principles of universal design to provide guidance in the design of products and environments (NCSU, 1997). When universal design principles are applied, products and environments meet the needs of potential users with a wide variety of characteristics.

UNIVERSAL DESIGN INDIA PRINCIPLES: Universal Design India embodies the democratic values of equal opportunity for all and seeks to address social and cultural diversity fundamental that is due differences in languages, cultures, economics and regions. The 'Universal Design India' project was undertaken under Jamsetji Tata Universal Design Research Chair at National Institute of Design, Ahmedabad. The developed five principles of Universal Design India address the needs of diverse Indian users across ability, age, socio-economic strata and culture and employ equity, usability, culture, economics and aesthetics to provide choices and further the social and equitable agenda of Universal Design. These principles have a vast scope of application ranging from product/ industrial/ communication design to built environments and human interfaces, from design education to policy making, and from social to national integration. Universal Design India Principles intend to build consensus on contextual definition and principles of practice. The five principles are listed below with descriptions, and guidelines to put them in practice.

Disclaimer

1. The UDI principles are stand alone universal design ideologies that focus in Indianness and inclusivity as they relate to age, gender, disability, caste, class, religion, poverty and urban/rural background.
2. UDI principles neither make any connection nor build on the 7 Universal Design Principles. They recognize the overarching importance 7 Principles in the field of universal design.

	Principles	Description	Guidelines
1	Equitable/Saman	The design is fair and non-discriminating to diverse users in Indian context	• Avoid prejudices against people of all ages, gender, disability, sizes, caste, class and religion. • Consider different capabilities of users and build in many levels of engagement. • Provide choices in access and use thru flexibility and customization. • Allow personalization through inclusion of adjustable and adaptable options. • Provide equality in challenge, opportunity and energy requirement.

2	Usable/ Sahaj	The design is operable by all users in Indian context	• Provide independence, comfort, safety and support during use. • Facilitate access, operation and convenience by diverse users. • Include adaptations for those experiencing difficulty in use. • Provide clarity in use, operation and maintenance to minimize instruction and avoid confusion and error. • Adopt simple means to overcome complex operation. • Follow cultural norms to address user expectations. • Offer multi-sensory feedback to point in the right direction. • Build in intuitive operation and innate understanding of problem. • Allow easy adaptation to facilitate use by people with diverse abilities. • Prevent costly mistakes and unintended consequence from misuse.
3	Cultural / Sanskritik	The design respects the cultural past and the changing present assist all users in Indian context	• Maintain social and traditional qualities in design. • Include Indian idioms to make historic and social connection. • Present in many languages for inclusive comprehension. • For all castes and society levels. • Respond to local context and conditions. • Employ appropriate technology to match user expectations.
4	Economy/ Sasta	The design respects affordability and cost considerations for diverse users in	• Ensure affordability, durability and maintainability. • Use local materials for energy savings and cost effectiveness. • Focus on low unit cost through wide distribution.

BENEFITS-UNIVERSAL DESIGN INDIA: Other than deeply grounded social values there are many advantages of the Universal Design in India:

Marketability: The majority of designers implicitly assume that users are young and able-bodied and do not have temporary or permanent ailments, they use products as the designer intends in regular circumstances. In the real world, users of a product may have diverse limitations, abilities or may experience a wide range of different circumstances. Universal Design expands the reach of designs to the diverse intended users to be used in diverse conditions, increasing the marketability of products, environments and systems. India is much more diverse compared to the western world with socio-economic and cultural diversity and 'Universal Design in India' will enhance the breadth and depth of the market reach to a greater extent.

Innovation: History has shown that including diverse users brings innovations in design, for e.g. the typewriter was invented for the blind and telephone for the deaf (DIAL, 2012). Besides small innovations that solve every day problems, India has shown little interest in larger innovations that could bring about a social change. This is primarily because adoption versus innovation has been the primary focus in India. As a result, little work has been done to solve major problems like traffic, transportation and public bathrooms and it hinders participation by Indians with and without disability in public life. 'Universal Design practice and research in India' will bring innovation in designs of products, environments and systems to address the needs of Indian population suiting Indian context.

Cost-effectiveness: Contrary to the popular belief, Universal Design is cost-effective as it helps avoid duplication of facilities/services. For example, a ramp set off to the side of entrance stairway or an accessible bathroom next to a 'regular' bathroom, duplicates facilities, adds cost and increases stigma to disability. With growing infrastructure and services to serve large and diverse population in India, 'Universal Design in India' will efficiently address the needs of diverse users without doubling the cost to serve them separately.

Economic Growth: There is large number of persons with disability and elderly in India who are totally dependent on their families; this creates economic pressure on the wage-earners and family members. Furthermore, lack of infrastructural facilities present serious challenges for persons with disabilities to perform routine daily activities and to access basic education. Persons with disabilities who are denied of education, are unable to find employment; driving them deeper into poverty which is difficult to break out of. 'Universal Design in India' will create equal opportunity environment and foster independence for all users with and without disability. This will reduce dependence, lessen burden on others, lead independent life, be gainfully employed, create economic growth and benefit the country as a whole.

CONCLUSION: The five principles of Universal Design India © (2011) address the needs of diverse Indian users across ability, age, socio-economic strata and culture. Developed at the National Institute of Design and co-authored by nine Indian experts, these principles employ equity, usability, culture, economics and aesthetics to provide choices and further the social and equitable agenda of universal design. These principles have a vast scope of application ranging from product/industrial/communication design to built environments and human interfaces, from design education to policy making, and from social to national integration. These principles would help strategize design activity and move India towards social and economic inclusion.

NOTE: The Universal Design Principles© 2011 is copyright of the National Institute of Design, Ahmedabad, India and its authors in alphabetical order include Abir Mullick, Anjlee Agarwal, Balaram S., Debkumar Chakrabarti, Gaurav Raheja, Haimanti Banerjee, RachnaKhare, Ravi Shankar and Shivani Gupta.

ABOUT THE AUTHOR:

Rachna Khare is a Professor and Associate Dean of Doctoral Programme and Faculty Development at School of Planning and Architecture, Bhopal. Prior to this she was a Senior Research Fellow with Jamsetji Tata Universal Design Research Chair at National Institute of Design, Ahmedabad and taught at Birla Institute of Technology, Mesra. Starting her career in early nineties as Exhibition Officer cum Designer in Jawahar Kala Kendra, Jaipur, she practiced for seven years in the field and then taught architecture for almost twelve years.

Rachna is a recipient of the prestigious Fulbright Fellowship and was affiliated with Georgia Institute of Technology, Atlanta, USA during her PhD. Her research interests in the field of 'Universal Design' and 'Designing for Special Needs' have earned her grants and awards nationally and internationally. Apart from Fulbright award, she is recipient of IMFAR-2009, Professionals from Developing Country Award, Chicago; Friends of Fulbright India Grant-2008, Lewisburg; Universal Design Award for Working professional-2011 by NEPEDP-MPhasiS, India and R&D projects from All India Council of Technical Education and University Grants Commission in India.

Rachna is well known as an activist and is a founder member of an NGO called MITRA. She also stayed convener of Kislaya Vidya Mandir for several years, a school for underprivileged children supported by BIT, MESRA and 'Asha' Stanford. She is also member secretary of DRONAH Foundation in India.

The Corridors of Learning

-Pragyana Mehrotra

It has been a long time since we roamed the sunny corridors of our College. A lot has changed in the meantime, yet a lot remains the same. The hope for a brilliant future shines on a sophomore's face every year as brightly as it did when we took our first tentative steps to join the Architectural Profession. We were naïve, we hoped to change the urban landscape with our brilliant creations, create masterpieces and secure a place in the exclusive list of Great Indian Masters.

In late eighties, it was still a laidback period, Information technology had not fast paced everything so that events merged and blurred into each other, making it difficult to know, understand, assimilate and draw lessons. We were heavily into visiting the libraries to study and cut/ copy/ paste features were yet unknown. Most of us looked forward to going back to our home town and establish a practice. Some of us dreamed bigger and hoped to get a piece of the very small pie, that was the private builder enterprise at that time. Many of us have realized our dreams, which is no mean achievement.

The whole education procedure was geared to produce competent professionals able to earn a decent livelihood. In all my years of private practice and consultancy, I have never had reason to feel inadequate on account of architectural knowledge and methodology, for which my heartfelt gratitude to my teachers and peers. They have remained an invisible backbone against which I have rested frequently.

In spite of the professional competence demonstrated by Architects from our Institute and others across the country, sadly, we do not see a maturity in terms of architecture, barring a few examples here and there. The growth of knowledge base has inversely affected our built environment. What is shocking is the state of Indian Cities across the country despite the growing quantum of knowledge and expertise on architecture and urban design available. To me, it is criminal, that, having the knowledge and competence, we still decided to look after our own interests at the cost of society. The country invested so much in our education, looked to us for guidance to help each and everyone secure a decent roof over their heads and all we had to give them was multistory glass encrusted facades, gated communities and slums contributing to enlarging the gulf between the haves and have nots, also destroying our strong social and cultural roots into the bargain.

A peep into the pages of history will show that the Masters of Architecture in India, made many efforts to guide us on the path of equitable distribution of assests within our society. With their work, they have tried to show us the wonderful diversity and vernacular architecture of India contributing to the strengthening of social bonds. We have chosen to ignore that path. Instead, we have created an environment in which architecture imported by renowned architects from western countries has become a benchmark of good architecture, be it ever so alien, not suited to our climate, energy resources and social structure. It is always easier to fall than to rise.

Since the syllabi of Colleges is probably designed to create competent professionals, the vision of creating a better society, the ultimate responsibility of an architect as a citizen of a new nation is not made explicit. Maybe it is assumed that - with greater knowledge comes greater responsibility, and we would fit into the role automatically. It has not happened.

Through this article, which our President has been kind enough to publish on this historic occasion I wish to draw your attention to what, in my humble opinion, still needs to be done and what we can do.

Our social conscience is limited to lamenting on the state of the country as though it absolves us of any guilt or blame. Government has invested in our education and though it may not look kindly to our interfence in what it feels are its Development Plans, nevertheless it is our duty to be proactive. As far as Urban Development is concerned , our government consists largely of administrative machinery with little or no knowledge of the nuances of the relationship between the built environment and the social behavior of people. We architects, are in the rat race to build as many number of dwelling units for Professional Fees and despite the Code of Conduct laid down, are stakeholders in many projects. We count to the last significant digit of decimal to provide the client/ builder with FAR and Covered Area. This attitude does not build a healthy and progressive society. It only promotes consumption of goods which the marketeers and Government is eager to promote for their vested interests. The best argument to support this point of view is that, we may come out of our house in a Mercedes but we will be travelling on pot holed roads along which we see the poor squatting and slums areas. For us to grow, the society must grow as a whole. Fortunately, we are in a unique position to help the dream of a Incredible India come true, would we but take the initiative. We have a rich legacy of towns and cities in our country, where people have lived in harmony for centuries, we need to study those, study the ancient text to find the good things that promoted our culture and life in harmony with our environment. WE must collect enough data to be able to design new townships and revitalize old ones in a manner fitting to our culture, and not the western concepts eugolised on television.

Through education imparted, we have to create individuals, who can rise above personal interests, have a character strong enough to lead and have the strength to face adversity. Our Institue is a repository of knowledge and keeper of faith of our families, who send their children here to become not only good professionals but also honourable human beings. These hopes have been justified in the past and we must pledge to keep this flame burning in the years to come.

Ours is new nation but our civilization is centuries old. We have proof of that through our wonderful Architectural Heritage, which is being lost in the race to make every city modern. If this continues, every city in our country will look like any other city. We are destroying that, which we have no ability to build. Look around. Other countries have seen the need to preserve the built heritage and also realized the potential of Heritage to improve Economy. They have preserved the old while providing modern day comforts. If we could not lead, at least we can follow.

We must incorporate social issues as a project for design for Degree Courses and take a more active part in the law making process that affects the city plan and urban identity. After all, we are citizens of a free country, and a united voice will be heard. We should all become part of Graduate Constituency to effect the same. There are other forums through which we can raise our voice, like Indian Institute of Architects, UP Architects Association, local chapter and even a Committee of Architectural Colleges in a state or city. If we only bother to look, there are many architects still raising their voices in the service of society, sometimes at the cost of their careers. Our deafness and ambivalence is making their efforts come to naught.

Critical Architectural Thought is non existent in our country. There are Principles of Design taught, there are theories of Design Concepts. Learning theory is not enough. We have to learn its application, and critique various projects to learn how great architecture is made. We are afraid of stepping on others' toes and current architectural magazines are contributing to the myth of good architecture being constructed around us. We must encourage open discussions between students, teachers and Practicing Architects without fear of offence. The learning thus obtained will allow us to question every step we take to design, ultimately leading to an architecture that is truly great.

It is difficult to see change happening, and we may be dispirited before positive results appear. Our strength is our peers who took the extreme step of risking their careers to do what was right. It is time to follow in their footsteps. Nobody has ever seen the changes that happen when a larva becomes a butterfly, but one day , suddenly , the larva is gone and it is a butterfly flying away. Change is like that,1 day it is suddenly there. Let us work towards it.

Thank you

envisage

Envisage journey comes handy to us in a contemporary packaging with eco-friendly ideation. We hate no ideas & believe that no idea is a waste. Our business is to deal with concept / ideas and translate them simply on ground – creating an impact upon your buyers.

In the business of brand activation keeping track of eye ball movement & making an in-road in the minds of your consumers is an unending process.

Now we know that the best way to sell our self is through "WOM" communication.

Earthen Pot Roof Insulation

It is a well known fact that the maximum heat ingress in any building is through the roof. And the rate of heat transfer is proportional to the thermal resistively of the roof material. Therefore if one simply uses a roof material which resists heat transfer , coupled with a cost effective insulation technique , the room temperatures can be lowered considerably.

In Rajasthan the ambient air temperatures in summers go very high; right upto 48*C. In traditional buildings the extensive use of stone in the walls and the roof provided the much needed time lag for heat to enter the building. In addition the roof would have thick layers of lime concrete, which would provide the necessary insulation to the variation in temperatures.

It was seen in some cases that inverted earthen pots were used to add an air insulation layer in the roof. The actual usage of these pots was for storing water which after the lifespan would be recycled to provide the solution to insulate roofs and also helped in creating the domes of rajasthani style chattries.

The idea, although very innovative as well as cost effective disappeared down the ages. This was mainly due to the downfall of lime as a building material and the influx of modern technology, which allowed air to be cooled by 'Desert coolers' as well as 'air-conditioners'.

Heat ingress in buildings

The first point to be understood by builders and mainly architects is that the heat ingress in a building is mainly through the roof which amounts to upto 80% of the total heat entry. The rest 20% comes through the walls. But that gets taken care of because if the walls are well shaded by plantation or louvres then the heat ingress is reduced.

The main aspect is that if the roof is insulated properly then the 80% component of heat ingress can be reduced to upto 30%. Although many techniques are available in the market but the cheapest amongst them and the most reliable is that of earthen pots.

Laying Technique

No special technology or labour is required for the laying of these pots. Once the RCC roof is cast, its surface is given a slope by cement screed which forms the base of the earthen pots. Then the pots are laid abutting one another tightly starting from one corner of the slab. Care is taken that no broken pot is laid.

Once the pots are laid, a 2" - 3" layer of PCC is placed gently over the pots in slope. Therefore forming the basic roof layer which in the local language we call as 'dhar'. Thereafter any floor finish can be made including terrazo laid in situ.

This layer of earthen pots are sealed from both sides and therefore the air trapped inside it forms an insulation preventing heat to travel from the top to the bottom slab. A fraction of the heat does manage to reach the slab using the walls of the pot as a medium. But then this heat is removed easily by proper ventilation in the rooms below.

In multi-floor buildings, heat travels from the roof slab to the next slab through the air (convection cycle) inside and through the walls (conduction cycle). So if the heat is curtailed at the very roof slabs then subsequently the rooms below become relatively cooler.

Case study

A small two floor residence in Jaipur with a roof area of approximately 2000 sqft. used this technique to provide cooling to the interiors.

The family was living on the ground floor initially and this single storeyed house was built by a builder. So they had experienced a lot of discomfort due to the climatic changes in the summers as well as winters.

When they decided to add another floor they had already plans for central air cooling by two large 24" desert coolers and air conditioners for the additional comfort in the bedrooms.

The owner was reluctant to insulate his roof with earthen pots as he had already budgeted for the air conditioners as well as central air-cooling system.

After some persuasion, he tried what he called as 'experimentation' at his expense. The results of this experiment were spectacular and his electricity bills came down by 10%. The difference between the ambient temperature and indoor temperature of the upper floor was upto 10*C.

They shifted in the new upper floors of the house in November 2001. The winters were cold but still the family members could walk bare foot on the granite polished marble floors of the house. The difference of the indoor and outdoor temperatures were upto 15*C making the house very warm inside.

In the summer of 2002 in which there was no rain fall, the outdoor temperatures were soaring upto 45*C. But the heat was not felt inside. Although they had installed the two air cooling units, they hardly had opportunity enough to use them. In the peak of the season they would switch on one air cooling unit at 12 pm and then would have to shut the system down by 4 pm because the house would become cool enough.

On some occasions both units would be used but then the time range was the same. At night time their cooling system would bring temperatures down to 28*C. They would have to shut down cooling system after mid night.

Cost Factor

The initial cost factor has always been a deterrent in executing any passive cooling system. In this case the cost was not a negative factor. As the labour contractor was hired on a lump sum basis he did not charge any extra money for the labour component.
So the cost was that of the earthen pots which were of the size 3" ht and 4" girth. One piece costed an average of Rs 2/-. In one square feet of area, there were nine pieces so the cost per square foot worked out to be Rs. 18/- per sqft.
In a roof area of approximately 2000 sqft of area the additional costing worked out to be Rs 36,000/-. This is the cost of one split unit AC, which was never installed. So the owner got lower electricity and water bills with such a small investment.
In terms of the whole civil work costing of the building, this additional feature worked out to be only 3.27% of the cost.
The owner claims that he has already recovered this cost in terms of his saving in cooling and heating bills.

Conclusion

Thus the fear of using the technique of passive cooling was removed from the mind of one user. It is hoped that many prejudices related to passive cooling shall be removed in the due course of time.
In fact this cost-effective method is so affordable that people building their houses with small budgets can also use it.

If this insulation method is made mandatory than it will also increase employment in the pottery cottage industry which is right now in a crisis due to the replacement of earthen ware glasses by plastic ones, specially on the rail-way platforms.

All in all, this not so new method of insulating method of roof insulation has to be revived so that the buildings being built provide greater comfort and are less dependent on artificial cooling systems such as the Desert cool-ers and Air conditioners.

Mukul Goyal
Architect

This article was written and presented in a National Conference in Jaipur in 2003. It got wide coverage in all local newspaper in Rajasthan which resulted in the revival of this long lost technology.

Stone in Outdoors of buildings

The 'Stone Henge' has fascinated people & scholars alike for centuries not for the purpose it was built for , but for the sheer magnitude of size of the stones placed one on top of the other.

History has been witness to Man's attachment to stone. Starting from carving out caves, discovery of fire, making tools (for agriculture), creating huts (leading to villages and civilised life), and thus the formation of Societies and Kingdoms leading to Trade and Commerce. It is hard to believe that this inanimate object could lead us to what we are today.

But here we are going to discuss the aesthetical joy, stone has given us in our day to day lives. To quote an example – the popular cartoon character Obelisk (& Astrix) was a monolith stone carver and as per their Gaulish tradition, the status of the house owner was seen by the size of the 'Menhir' placed outside his house.

In today's context, the same holds true in the usage of stones on a building and around it. The most popular usage being that of application of stone on walls which is known as cladding. Through the 80's and 90's the major way of showing one's status was to clad his house and boundary wall in stone.

In the recent years Architects have shown more interest in Aluminium, Glass and texture paints for building facades. But this threat of modern materials has also forced them to use Stone in a more mature way on facades and in the landscape. To add to their creativity, suppliers have brought out a wide range of stone products which could be used on a variety of surfaces. To get a correct insight of the range, every second year an international exhibition of stone products is held in Jaipur. The other alternate year it is held in Bangalore.

But before going to the exhibition it will be prudent to know exactly what stone to look at and where to look for. To start with, majorly all outdoor stones have been grouped in the following catagories :

a) Sandstones : Dholpur red/Beige, Mint, Budpura, Lalitpur, Modak, Mandana
b) Quartzites : Karrappa, Silver shine, Peocock, Himachal
c) Slate : Copper, Grey, Green
d) Limestone : Kota, Jaiselmer,

All stones above are cut in the form of Slabs , Tiles, Cobbles, Steps, Palicates, Pebbles, Mosaic tiles. These products are then further processed and designed to suit various Landscape surfaces in various color combinations.

For example we are aware that the most popular pathway stone is Natural Red Sandstone. But then other alternates can be Brown Kota tiles, Black Karrappa cobbles, or a mix of the both. It all depends on the Landscape designer choice.

Another favourite stone being widely used is Natural Mint stone. It is the only available white stone for outdoors. In natural form it is milky white (used for pavings) whereas when polished it gives a rich off-white color which can be used in interior cladding also. With different finishing textures this stone can give a variety of color tones. In fact this is true with all stones.

Therefore textures also make a great design impact. With the availability of international level technology , machinery and equipment in Jaipur (and other cities in Rajasthan) almost any texture is possible to be created on stone surfaces. Some of the textures which are popular are listed below :

S.no.	Texture	Description / process
1.	Natural	Handcut stones from the mines. No machine process is applied.
2.	Honed	Machine processed Matt finish
3.	Callibrated	Machine Blade cut stones with equal thickness and one side natural/grooved
4.	Polished	Machine – Table rub or Granite finish
5.	Antique	Natural + Brushed - Machine removal of sharp roughness from stone surface and edges BUT retaining the natural texture.
6.	Brushed	Diamond brushing of any rough surface to maintain rough look but making soft (smooth) to touch
7.	Viberated	Similar to Antique except procedure is different and little inferior to Antique
8.	Tumbled	Rounding sharp edges of Cobbles and small stone tiles. Old cement mixers are used to create this effect
9.	Sawn	Machine Blade cut stones. Plain surface due to the blade.
10.	Sandblasted	Machine jet of sand to create a degree of undulation on Sawn surfaces
11.	Shot blasted	Machine jet of iron balls to create a greater degree of undulation
12.	Water Blast	Softer version of Sandblasting. the stone does not change color and gives an even undulated surface.
13.	3D Polish	A finer polish on a Natural surface creates a shiny patches wherever there is maximum undulation whereas the sunken surfaces retain their natural look. Thus two shades appear on a single stone.
14.	Flamed	To create spot/designer roughness on polished surfaces by flame torches. Mainly done on Granites. Can be done on Sandstones.
15.	Handcut	Cut edges created by hand on tiles or cobbles
16.	Chiseled	Textures created by chiseling surfaces of rough or processed stone

So if you want stone for steps of a Heritage property, you can opt for Budpura stone which is firstly 'viberated' and then 'shot blasted'. This will give it an antique feel. For the wall cladding you could go for a simple brown Kota stone which is 'sand-blasted' and then 'brushed'.

In landscaping the most popular textures are the 'Natural'look. This is followed by 'Handcut' and 'Chiseled' finishes. For a modern corporate look , many architects are using 'sandblasted' surface finish on the exterior stones. The permutations and combinations are endless. You could play mix and match with your vendor for hours. You just require the basic knowledge of the available options in your city.

Lastly, needless to say that stones are everlasting. No other building material has the immortal property to amaze the onlookers. So it is very important as to how and what you select. And while doing so, do remember that you are creating history for the next generations.

Mukul Goyal

About the author :

Architect Mukul Goyal , graduated from the Govt College of Architecture , Lucknow in 1994. After working in Delhi under a famous Landcape Architect (Mr NG Shastri) , he joined MNIT as Lecturer and taught Landscape Architecture for eight years in the Dept of Architecture.
Thereafter he resigned in 2003 and joined his wife, Ar. Archana Goyal as associate in 'Vis Arch'. They have since designed many prestigious Landscape, Architecture and Interior Projects in Rajasthan.

"SIGNIFICANCE OF OPEN PLAN KITCHENS IN INDIAN SOCIETY"

-Sanchali Srivastava

It's a Paradigm Shift!!

Young couples in India these days have a fast paced life, with both the husband & wife working. Do we need to give some thought to what we can change, so the sanctuary that we call "home" is a real retreat from the hustles & bustles of everyday life?

Kitchen is the "Heart of the Home", a place where every family spends at least some time of the day... Imagine that after a long day of work, the wife comes home and there is the kitchen, centrally located in the house, connected with all other spaces, and open to the Family room... Imagine that the Cooktop is on an island in the kitchen and the wife is cooking dinner while the kids are sitting right across doing homework...Imagine that the wife is watching TV, mounted on the opposite wall while cooking dinner, and relaxing her nerves with the only entertainment she gets in the day...Imagine that the husband is also sitting right across on the island and talking to the wife, while she is preparing dinner, sharing some of the moments of the day. It would be a tight-knit family, where the family has just spent that little time together, that they could get in the entire day!

Island with Cooktop & seating

Well, what does it mean to break open that one wall that separates the closed-off kitchen from the rest of the house? What about the storage that would be lost because of the wall cabinets gone on that wall? Design solutions can compensate for the lost storage. In the adjacent picture, the kitchen cabinets are stretched beyond the kitchen. This not only adds more storage, but the extended counters can be used to serve food during large gatherings. Imagine that the hosts can still talk to the guests, while working in the kitchen. A much more interactive environment! Some people like to sit with their guests in the Drawing room, while their servants prepare the food in the closed-off kitchen and bring it to serve their guests. Now for a moment lets place the guests in the Open-plan kitchen, so where do you think the hosts will be? Probably participating more in serving their guests, which is likely to receive good appreciation! Toss up a salad or a paella – no longer is cooking relegated to what others do. So enjoy the opportunities an open kitchen provides1! Open kitchens change the very act of cooking from an isolated needed chore to a participatory social activity and a way of life5.

Stretching cabinets beyond the kitchen

"Memsaab, I'm not feeling well, so I won't be coming tomorrow!"...- sounds familiar?? We need not be at the mercy of maids! How about a Dishwasher in the kitchen as a stand-by arrangement, so the busy female of today is not left with the option of now spending an hour washing the dishes? It's all about time management and where one wants the hours of the day to go! These small changes in the kitchen can make life so much easier and free the time to spend with family. And good appliances in an Open-plan kitchen can also be a statement in the interior3.

"I do not like the fumes and odors that fill my kitchen with the style of Indian cooking that I do!" Some people refrain from going into the kitchen, because of the fumes and odors which bother them in a closed-off space. So, what will happen to the "fumes and odors" in an Open-plan kitchen? Will that be worse with the odors spreading in the whole house now? ...With the improving technology, the hoods are becoming more and more powerful, and can draft the fumes significantly well. And technology will only get better from here! So let that not be a constraint to create an environment that is desirable for the kitchen. Worried about the Guests seeing all the clutter in the kitchen?? Believe it or not: People try to stay more organized when they have an Open-plan kitchen. Certain habits, if developed, will go a long way to keep the kitchen clean. "I put dishes in the dishwasher immediately. I keep a disinfectant spray handy to wipe away spillages as they occur"5. Having a slightly higher counter can sometimes screen all the clutter in the kitchen, as seen in the adjacent kitchen. Also, with an Open-plan, the cabinets can have a display area for the expensive crockery, so now you do not need a separate crockery cabinet by the Dining room.

Many people in India consider the kitchen to be a Holy place...a place where religious deities are placed, and only the "pure" can enter, so what implications will there be if that family was to plan an Open kitchen? Again, with a good design, solutions can be offered, where the deities are housed in a cabinet, that is in a location screened off from Public view.

Open plan kitchens also open up the rigid boundaries between gender, class and religion. In many households, the "working together" concept is becoming more and more common. Observe how people gravitate towards the kitchen when it's more open and gives a more inviting feel. Time has resulted in some osmosis, but the Indian society is such a mosaic of different beliefs, lifestyles and languages, that elements like Open-plan kitchen work to unite these differences.

Powerful Hood, Higher Counter & Display area in cabinets

With the number of nuclear families increasing every day, the support of joint family structure that used to be there before, is becoming less and less available. And with the changing lifestyles in India, it is necessary to give some thought to adoption, adaption and invention that would create a balance between the professional and domestic lives of people2. With advanced technology and more cost effective options these days, it is possible to have an Open Plan kitchen that makes a home into a "retreat", and caters to the everyday needs of family-time, social interactions, place of worship and ease of use.

So, wait and watch my friends...very soon the Open-plan kitchen will not be a choice, but a "necessity" in every Indian household!!

Designing Elevation to Elevating Urban Competitiveness

-Dr. Shaleen Singhal,
Head, Department of Policy Studies, TERI University
ssinghal@teri.res.in

The vital and diverse role of architects ranging from design of buildings to revival of responsive quality-led built environment with a wider influence on performance of cities is being recognised globally. Professionally trained ability to observe, conceptualise, detail and execute with a distinction, is what makes this genre stand out.

Evident is that a multi-disciplinary approach, catalysed through design related skills, well-structured with planning, real estate & city business management expertise and technological innovation will make cities competitive. The three key markets namely occupiers market, investors market and developers market can be highly influenced for urban competitiveness through strategic engagement of these designers of space. Progressive integration of skill sets and knowledge, facilitating transformation of physical environment and attraction of quality social capital and investment will be the winning proposition for modern cities.

Vastu shastra – validity in today's context

-Ar. Sunil Srivastava

No, longer it is enough to say that you have a Charles Correa or Hafeez Contractor designed home to impress anybody. Now, recent phrase is; Whether your home is Vaastu correct? Vaastu is the newest architectural media event. There are several books available in the market on Vaastu Shastra but what is Vaastu Shastra ?No one comments on this. They only write about function disposition only. It is like a Satyanarayan Kaatha in which the storey moves around a person who has ignored the Kaatha but what exactly is Satnarayan Kaatha, pundit never tells. Adherence to Vaastu Shastra has suddenly assumed tremendous significance particularly among the well educated, well –to-do and largely westernized urban India. It is difficult to predict whether this is just a fad or fashion or will it influence the way of building dwellings, offices, factories and clubs in the future. The task is demanding to rediscover in the past the essence of its ethos and then redefine/ reinterpret it in a today's context because living habits & working style, transportation system, gigantic growth of population, advent of new building materials & construction technology, economical conditions as well as environmental conditions have been changed and created a question mark on the validity of Vedic literature available in the market (present books in the market does not carry any significance).

There is possibility of some errors might have crept in making copies of handwritten scriptures. Printing technology was unknown to the ancients. Many words may have changed in meanings over last many centuries. One should use a scientific approach in dealing with ancient scriptures. Today, one set of practitioners of architecture are concerned with that part of Vaastu Shastra which deals with orientation principles and astrological application and the other with their own perception of its visual and aesthetic appeal, and the spatial organization of the built form . Whether under taken by architects, astrologers, priests or craftsmen, the use of Vaastu Shastra today is , therefore , invariably fragmentary in violation of its proper character and original purpose. A study of Vaastu Shastra's main texts reveals an organized system dealing with every aspect of building design. In looking at its applications, however one sees that this coherence has been broken down against onslaught of modern influences.

Vaastu Shastra, the Indian Knowledge of architecture is as old as Vedas which belong to 1500- 1000BC. There are more than 800 books and manuscripts written on all the branches of Shilpshastra or engineering listed in the Bhrigu Samhita. Out of which only 80 odd have been published and only few translated either in English or Hindi. All these written treasures in handwritten manuscript form were compiled during various stages of Indian history from the early centuries of the Christian era to the seventeenth century and were translated into built form. Its first textural evidence was found in Rig Veda. The original sources of knowledge on the subject are abundantly found in texts such as Kashyapa Shilpa Shastra, Brihat Samhita, Viswakrama Vaastu Shastra, Samarangan Sutradhara, Vishnu Dharmodhare, Purana Manjari, Mayamata, Manasara, Apparijitccha, Shilpa Ratna Vaastu Shastra, etc. These text gives a lot of information on Vaastu principles describing orientation, site planning, VaastuPurush Mandal, shape, size, aesthetics of buildings, materials used for construction, system of proportionate measurement and astrology. In these literatures, most of content is regarding temple architecture, town planning & palaces of kings whereas very less portion of this literature goes to house planning. However, literature on house planning is based on hierarchy of caste systems. According to Purana sources, "Lord Vishnu taught Vedic knowledge to Lord Brahma who, in turn, taught this to other great sages and mystics including Narada Muni who later passed it on to others. This is

where the oral tradition continued over thousands of years and the knowledge of Vedas was carefully handed down from one generation to the other. Sage Vedavyasa divided the Vedas into four parts and put them in written form."

Vaastu Shastra as projected today is not an ancient book instead inferences of many vedic literature compiled together and put into a book form. The Vaastu Shastra book as of today discusses only about function disposition only whereas Vedic literature deals with origin of earth, creation of continent/ ocean, rivers and countries, meaning of architecture, system of measurement, qualification of architect, quality of soil, location of land, selection of site, demarcation of site, establishment of north direction, orientation of buildings, way of offerings, village schemes, size, shape and location of houses for different caste of people, scale & proportion of building and their elements with respect to concerned person, storey plans, details of courts, compound, temples, description of gate houses, pavilion, function disposition for different caste of people, details of chariots , conveyances, furniture, description of god and their image,etc.

The Vedic literature never says that east facing plot is good and south facing plot is bad. In fact, this is the interpretation of middle persons. The basic problem is to understand the Vedic literature because they all are written in Sanskrit and shloka form. The translator can translate the meaning but cannot narrate the actual message that shloka carries because translator is not expert of architecture. The present Vaastu Shastra says that south facing house or market is inauspicious means they will disturb the health and wealth of the concerned person but it is not so because the sale of the shop depends upon many things like behavioral attitude of sales person with the customer, quality of material one keep, collection of material, presentation techniques, pricing of material, etc. This means that we need to review vaastu shastra in today's context. Let us take some example which is being quoted in vaastu books of ancient architecture.

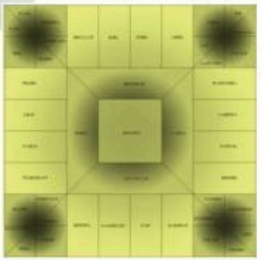

As per most of vaastu books

It has been found that there are 32 patterns of making layout, out of which Chandita (House of 64 plots) is recommended for house making, layout of colony, city planning and for temple planning whereas Paramshayika (house of 81 places) is recommended for house planning. There are forty five deities in both the plans.

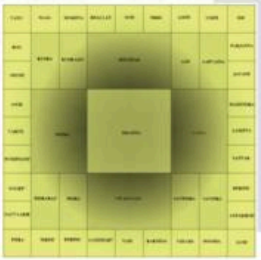

Validity of above in modern context:

In today's context, grid iron pattern is being used for site planning and it has certain advantages over irregular patterns. Chandigarh is best example of modern cities. The advantages are;

1.Plots are in rectangular shape or in square shape and hence no wastage of space is met.
2.With appropriate orientation, natural cleaning of roads by wind can be achieved.
3.Easy flow of transport system.
4.Minimum cost of services.

Chandita Plan
(House of plots)

Paramshayika Plan
(House of 81 plots)

Validity of above in modern context:

1.The temple of god should be placed in North East because sunray first glimpse at East with slight North direction. So god should get shower of sunrays first. In our climate most of time we get Easterly or westerly winds. By keeping temple in this direction, the pious air of pooja moves through whole of the building and refresh the environment.
2.Bathing room should be in East so that after taking bath one can pray with sungod and enjoy the cosmic rays released by the sun in morning.
3.Kitchen is a place where we cook food, wash utensils, cut vegetables, store grains and eatables or we can say the environment of the kitchen is good for development of harmful bacteria. So, it should be placed in South East so that sunray (ultra violet rays)may penetrate inside the kitchen and can kill all harmful bacterias.
4.In North direction, we always get indirect light and we don't get sunrays which in turn makes room cool. So , it has been suggested that we should keep godown in this direction.
5.For Curd extraction room and ghee room has been placed in East and South direction so that sunrays may kill all harmful bacterias and further during process of curd formation, higher temperature of the environment is desirable.
6.The intensity of sunrays in South west and South zone is considered very strong and infrared rays from sun comes which has the power to kill harmful bacteria, so toilet has been suggested to place in this zone
7.Reading room should be placed between South west to west direction so that this room can get direct sunlight with low intensity during afternoon to evening.
8.Weeping room should be placed between west to North west so that when air flows all the greviences should pass out from the house directly to the environment.
9.Love room should be placed between North west to North because that area is cool which is desirable.
10. Medicine room is suggested to keep between North to North East.which is also cool in comparison to rest of the house which is desirable for medicines.
11. Delivery room should be kept at South west so that infrared rays can kill all the bacterias developed due to delivery.

RECOMMENDATIONS

After study of vedic literature, it was found that all suggestion made in shastras are for open field (large size plot) but in today's context we have very limited land so row housing system is being followed by Government as well as private developers where land can't be left on all sides, In fact, New by- laws suggest no side set back up-to 300 sq.mt. plot which is normally large size plot available in the market. Further, the building services are existing on the site so we can't plan that all drain should be towards North and slope of all rooms towards North. Therefore, following vaastu suggestions are being recommended for design of houses which have been proved on the litmus of modern science.

1.The ground should be high on South & west and low at North & East direction. This will overshadow north & east direction building and hence reduce heat gain from south west direction.
2.Hillocks or mound on South west side is good. This will also reduce heat gain from south west direction
3.Water body on North East is desirable. This will allow cold breeze to enter in the house during summers.
4.The built form of the building should be square or rectangle for structural stability and open space all around building is desirable. More space should be left on East & North direction and less space on South & west direction.
5.The height of building in South & west should be higher.
6.Balconies should be on North and East. This will give morning cosmic rays to the habitants.

7. Thick wall on South & west is desirable. This will reduce heat load from South West direction.
8. The land should be selected in or around the city or town but it should not be far away from the main city or town. Further, land should be selected in planned and developed colony as it will save the cost of other development like water tank, boring and septic tank / soak pit and provide better habitable & livable condition.
9. The shape of the plots should be either square or rectangle because square shape has minimum periphery. The suggested proportion for rectangular plot should be 1:1, 4:5, 2:3, 4:7 or 1:2. The breadth to length ratio should not be more than 1:2 because it will lead wastage of space in circulation and cost of services will also be increased.
10. The land should not be selected near temples, community halls, tanneries or major road crossing because they will disturb the day to day living of habitants by noise pollution, air pollution, etc.
11. First of all building should be constructed on South side. Later on, building should be extended towards west side followed by North and East direction.
12. The undulated and low level land should not be selected because it will increase the cost of construction due to deep foundation. It should be also insured that proper air movement is present at site.
13. While planning, we should not place the door in centre because it will disturb the privacy of whole house. The proportion of the rooms, windows and other things should be designed in proportion of golden section (fabunancci series) i.e. 1:2, 2:3, 3:5, 5:8 , etc.
14. The offsets in the building creates structural imbalance in the building therefore, offsets should not be provided. However, if this is the constraint of the design then due consideration should be taken for earth quake resistance during structural design.
15. There should be ample open space on North and East direction while minimum space should be left at South and west. The face of the building should be towards East and is best. North and west facing building is good. In Shastra South facing building is considered as worst but in our opinion South facing building is as good as west facing building.
16. Store room and treasury room is suggested in North because North side of the building is coolest and never gets sunrays which has capacity to kill the germs therefore, it is advisable to keep the store in North.
17. Pooja room should be kept at North East so that after pooja, the air which contains good fragrance and capacity to clean the environment must pass through all rooms (since air moves from East to west).
18. In our country which has tropical climate, courtyard planning is best for natural light and ventilation but in modern scenario, if the whole building is to be air-conditioned then courtyard planning does not serve the purpose. However, if courtyard planning is done then courtyard should be lower than rooms for proper drainage system. The size of courtyard should be 25% to 33% of the width of the building.
19. Bathroom should be placed in East so that ultra violet rays(320nm-400nm) can kill the bacteria inside the bath room and one can get cosmic rays of sun after bath for better health.
20. The kitchen should be placed in South East because when sun rises to South East position then sunrays containing UV rays can penetrate inside the kitchen and kill harmful bacteria / other germs.
21. While sleeping, the head which is North pole of the body should be towards North so that repulsion should take place between body North and earth North and hence reduction in blood circulation speed and finally sound sleep would take place.
22. Before demarcation of plot, actual North and South direction should be established. Thereafter, it should be carried out with pegs & rope and bench mark should be constructed in brick work showing centre line di-

26. It is advisable that same material should be used for any particular work like if brick work is in 1: 6 then plaster should be also in 1:6 or if roof is RCC then whole roof should be RCC (No part should be RBC) or if teak wood is used in one part of window then whole window shall be of made of same teak wood.
27. The number of steps in one flight should be minimum 3 and maximum 13 (as per Shastra maximum no is 123).The size of tread should be more than riser.
28. The size, shape, location, specification of the plot/building was based on caste system in Vedic period which has been replaced with modern economic system of the society. The economic system has divided the society in four parts i.e. HIG, MIG, LIG & EWS.
29. In Shastra doors has been provided in all direction but due to security constraints, the door is provided only in front and side direction.
30. If dome is desired on the roof, then first it should be filled with octagon followed by circle. However, in modern condition the dome can be erected directly on the structural slab.
31. Lattice windows should be provided for better light & ventilation. This should be provided in the stairs.
32. As per Shastra, the size of the window should be 1.5 hasta to 6 hasta. So, the size of window should be in-between 2' to 9'.The advisable size for window should be in the module of 1'-6".
33. The bearing capacity of the soil should be checked before start of structural design and construction. The moisture content should be also checked.
34. The black cotton soil after getting moisture gets swelled while on drying gets cramped. This nature of soil can create cracks in foundation and finally will lead to failure of structure. So , due consideration should be made while designing of the foundation of the building.
35. The size of door/ window frame should be 3"x4" to 3"x6" as per requirement of the site condition.
36. In Vedic system of measurement, different units were made based on one's own physical data (human scale) like angula, hasta,etc. but in modern system of measurement, MKS system of measurement is being followed.
37. Instead of rope of Vedic instrument, we should use metallic tape and modern equipments.
38. All angles of building should be made 90 degree and roof should also make 90 degree angle with the walls. If any change is need of the design then it should be checked in context of interiors, psychological impact on mind, effect of climatic conditions and structural design.
39. As desired bricks with lime mortar in earlier time, it is now recommended to construct RCC framed & earth quake resistant structure or earth quake resistant structure with load bearing walls. The strength of lime mortar achieves in six months while strength of cement based material achieves full strength in 28 days. At the same time, life of the cement based material is less than lime based material.
40. The design of foundations, columns, beams, lintels, roofs/slabs and load bearing walls should be as per beuro of Indian standards. The foundation should be kept at firm ground. Generally, spread foundation is designed however, in black cotton soil, pile foundation is recommended.
41. The wood should be selected from tubular tree which has more strength and minimum wastage of wood. Proper seasoning of wood should be done either by natural method or by mechanical method to ensure check on expansion and contraction of wood due to seasonal changes.
42. It is advisable that land selected should not have foreign material as infill. If it is need to erect the building at this location then proper soil profile (layer of soil, filled up soil,water,rock,etc.) should be taken and after studying this foundation of the building should be recommended. The surface infill material should removed otherwise this may lead psychological problems.

43. The bricks selected for construction should be free from cracks and pinholes and have metallic sound while collide with each other. During construction, proper bonding between bricks (interlocking) should be ensured. Racking should be done and vertical joints should be discontinued.
44. It is advisable that new and old material should not be joined together unless it is need of the project because old material gets adjusted with the environment for quite long time while new material will behave differently with the seasonal changes and finally development of cracks and loss of strength of materials.
45. According to Shastra, the location of the new town should be along or near the river, natural reservoir, lake, etc. because water way was very prominent and it was a source for life. Now in modern context, very few new towns are coming up in virgin land however, most of the towns are expanding along the highways or new towns are coming up on highways as satellite town. In my opinion, after fixing of boundaries of one town, it should not further stretched because if the size of town is beyond control then it will be very difficult to manage traffic problems, short of green spaces, se wage problems, water problems, etc.
46. The infrastructure facilities of the town should be designed for next 100 years. The main roads should run East – west while artillery /service roads should run North South direction.
47. The town should be planned with differentiation of zones like residential, commercial, industrial, services, district facilities (district park, hospital, administration authority compound, bus station etc.). The layout of the roads which are artilleries of the towns should be designed properly (its size should be projected for next 100 years population).
48. Huge entry gates should be provided on all outgoing roads at outskirts of the town. This will give a feeling that town welcomes you and people inside will be safe up to some extent. This will also help police authorities to have check on any causality like escape of notorious element.
49. First of all bhumi poojan should be done followed by neev (foundation) poojan. Thereafter construction of house should be carried out with proper guidelines and finally Griha Pravesh (house warming) should be carried out followed by lunch or dinner as the case may be.

GCA @ zonal nasa convention 2013

zone 4

Our college- **Faculty of Architecture, G.B.Technical University, Lucknow** lies in the Zone 4 of NASA IndiaZonal convention of zone 4 of national association of students of architecture , zonasa 2013 : ADHASTHALA was organised on 14th,15th,16th October 2013 at faculty of architecture, met, Moradabad.

A delegation of 40 students accompanied by a faculty member and unit secretary and unit designee from faculty of architecture, Gautam Buddha technical university, lucknow participated in a series of formal, informal and casual events and seminars by various eminent architects such as ar. anil laul, prof. S.s. bhatti, etc. and emerged as winners and runners up of many events and as zonal champions of zonasa 13.

The team from our institution emerged as **champions** beating 28 colleges from 7 states of the country:Uttar Pradesh, bihar, Jharkhand, west Bengal, assam, Orissa, Andhra Pradesh due to the able quidance of our dean/principal prof. Jagbir singh, our H.O.D. prof. Rajiv kacker, nasa unit advisor prof. Ritu gulati , other faculty members and our seniors.

एमआईटी में लीन जीतने के बाद विजयी मुद्रा में लखनऊ के खिलाड़ी।

जागरण

जीबीटीयू लखनऊ ने झटकी जोनल ट्राफी

मुख्यांश : एमआईटी में चल रहे जोन मीटर रहे।

हरियाणा जोनल 2013 (नेशनल स्तरीय आल इण्डिया इन्टर आर्किटेक्चर) अध्ययन के सात जोनों के विजेताओं को जेनरल ट्राफी जोनों के विजेताओं को जेनरल ट्राफी जीबीटीयू लखनऊ ने झटक ली।

प्रतियोगिताओं में जीबीटीयू लखनऊ के आर्किटेक्चर विद्यार्थियों को परफारमेंस ट्राफी पर बीआईटी पलरा और सीमेंट स्थान पर एमआईटी मेरठ और सीमेंट स्थान पर जीबीटी लखनऊ रहा। इसके अलावा कलोर स्पर्धा भी प्रतियोगी टीमों को पुरस्कृत किया गया। विजेय टीम को एमआईटी कालेज संचय स्पर्धा मुंबई और पी.जी.गोयल ने पुरस्कृत किया। इस अवसर पर सभा के पूर्व चेयरमैन अतनिंद्र सेनगुप्त, महाधिवेशक प्रो.एस.मजूमदार, निदेशक प्रो. विनीत गौतम, आर्किटेक्चर विभागाध्यक्ष मनोज तिवारी, प्रोफेसरीय जीतम मुंजाल कुमार सिंह, प्रो. डा. पंकज शर्मा आदि मौजूद रहे।

हमको सिला पुरस्कार : इकबाल राव एमआईटी मेरठ को प्रथम, सेनगुप्त आफ द ईयर पीसीपिरोने में पीसी लखनऊ को प्रथम, आकाश प्रतियोगिता में रुद्र फेरा प्रतियोगिता में जीबीटी लखनऊ को प्रथम, आकाश प्रतियोगिता में एमआईटी पलरा को प्रथम स्थान मिला।

अंतिम दिन बह हुए कार्यक्रम : शाम के समय पुरस्कार वितरण से पूर्व सुधर कार्यक्रम की शुरुआत दीप प्रज्वलित करके सभागार की मुख्यअतिथि प्रो.एस एमआईटी कालेज के आर्किटेक्चर प्रो.एस सुब्रमणि ने इंटरनेशनल विभिन्न विषय पर लेक्चर दिया। इसके लेक्चर विषय पर लेक्चर ने पुरुषोत्तम, विजाइन विषय पर दिया। सेमिनार के बाद प्रतियोगिता शुरु हुई। जिसमें सबसे पहले लाइट एंड डेरो, विजाइन, कालचैरेक जैसी कई प्रतियोगिता

अब निरस्त होंगे

The entire duration of the three day convention was systematically divided into casual events that tested our fun quotient,informal events that focused on the creative streak in budding architects , formal events that addressed various issues that architects face by the means of design exercises and problems and seminar by eminent architects on viable issues such as seminar by Anil laul on his eminent and famous projects and Prof. S.S. Bhatti (founder chairman of Chandigarh college of architecture) on sustainable architecture .

Also,the students got a chance to display their works and to view and study works of various participating colleges with the help of the REUBENS TROPHY. Our institution, Faculty Of Architecture,G.B.T.U., Lucknow emerged as the **winners of this trophy** after extensive jury and discussions on the panel comprising of the college work

Overall	**1st**
Rubeans Trophy	**1st**
Culturals	**2nd**
Main Design 1	**2nd**
Main Design 2	**2nd**
Landscape Design	**1st**
Interior Design	**1st**

WINNING ENTRY ANDC 2009

A Travalogue (Edited, Photographed & written by Akshay Agarwal)

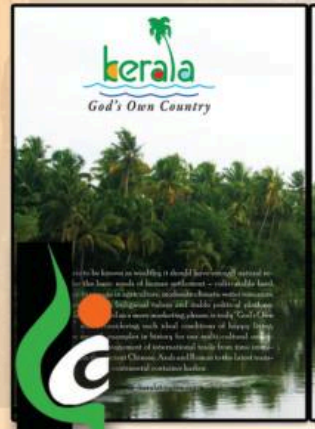

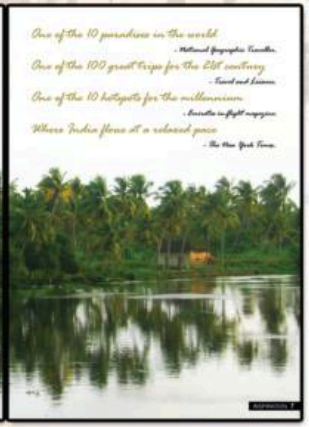

Because not every sort of beauty can lie in the eyes of the beholder, cameras were invented. They capture the moments, give you the chance to perceive and relive them. I have made this attempt to make you relive the beauty of Kerala. It would not be as splendid as the real experience, but yes, it would certainly give you the glimpse of one of the most exotic Asian destination.

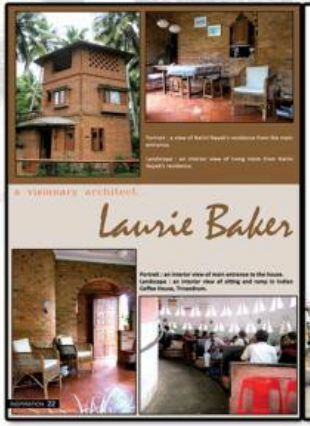

Kerala is down south and I am a north Indian. The eyes are accustomed to rivers and wheat and corn fields. Kerala is a juxtaposition of my notions of natural beauty. It has the blue seas and tea estates. Rice is what the natives thrive on. The way the nature and lifestyle of the locals blend here is what took me by surprise. No, it wasn't the difference. It was the stark similarity that we have as Indians. They live to love and revel in the common joys which make us Indians. Yes, traditions and sari, cricket and stock market, everything holds the pulse of existence just like it does up here in the north. Five months of living in Kerala made me realize that nature and beauty, life and happiness are not geographic. They are solely dependent on the common civilization that has cradled the best of mankind since 10 millennia. Kerala makes you proud of being an Indian just like moving from under the India gate at New Delhi does!

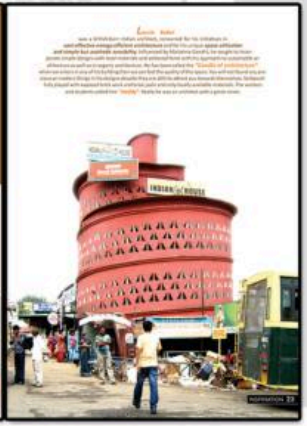

Hence I have composed my whole experience in the form of a magazine in which the whole photography, written text and the editing as well is wholly belongs to me. Here is the glimpse of that magazine.

In the search of 'livelihood'

An open space, almost completely uncovered, Mullick Ghat flower market is directly underneath the Howrah bridge in Kolkata, a sensory overload of sights and smells that's very photogenic. There is no discernible market stalls, just vendors sitting on the ground with piles of flowers, leaves and grasses.

of interest rates. The seminar was a grand success because of the presence of many students from management institutes of the city.

City lads shine in architecture quiz

LUCKNOW: Rahul Jadon and Swapnil Singh from Government College of Architecture, Lucknow, secured the first position in the recently concluded Northern Interface of Archumen 1314, India's biggest architecture quiz. The awards were given away by Chetan Vaidya, Niranjan Bhowal, Vijay Garg, Kapil Mehta, Abhishek Sharma from ROCA and Ranjan Mittal. The winners of the regional interfaces received ₹5,000.

HTC

Archumen'13

Rahul Jadon and Swapnil Singh of final year at Archumen won the stage and qualified for Grand Finale.
The teams on stage were Chandigarh College of Architecture, IIT Roorkee, SPA New Delhi, MITS Gwalior, and KR Mangalam School of Architecture and Planning New Delhi.There were around 175 teams from 35 colleges of architecture that took part in the event from north.
The Northern Interface of Archumen 1314, described as India's Biggest Architecture Quiz was held in association with ROCA, Pidilite Industries and Grundfos Pumps at the School of Planning and Architecture Auditorium. Hosted by Ethos, Archumen has completed its ten years and running on a successful 11th. It has secured an entry into the Limca Book of Records 2013 edition.

Do all things urban have to be ugly too?

Going to discuss that all the things urban have to be ugly too. But are we in a situation to discuss about the ugliness of that environment in which we are surviving? Here this question is raised because the definition of the word ugly varies from person to person and place to place. It may be different for different people in different situations. As a famous poet of English literature "John Keats" has also said that "Beauty lies in the eyes of the beholder". Let⊠s take an example in the reference of architecture; the construction of any building or structure which fulfills the need of a human being, on the other hand it also has many demerits which causes harm to the nature like deforestation, pollution, etc. Now let⊠s take another example of a cell phone. As we all know that at present in our day to day life a cell phone is the basic necessity of an individual. So, we can imagine how important it is for us as it is the best way of communication now days. But, on the other hand we all are neglecting the bad effects of this cell phone as it leads to head ache, anxiety and the most harmful effect is that it produces carcinogens, the agents which produces cancer. So after knowing about all these harmful effects we all are using cell phones continuously. Above we see very common examples from day to day life related to urbanization which is good to some people and for some they are bad also. So we cannot conclude about the aspects of urbanization whether the urban things are ugly or not.

Now coming to the topic, we have to discuss that all the things urban are not ugly. First of all, if we talk about the huge price we are paying for the development at a crazy pace, then according to my opinion, it is not a bad thing. The development which is taking place from this money is only for the luxury and comfort ability of a person which also fulfills the needs of that person. The price we are paying in the form of taxes is expanded only for the human we fare such as we can take an example of a road or an over bridge. They are only constructed for the common man so that they have to face least and least difficulties to reach their destiny. Now days a lot of entertainment centers, parks, malls, shopping centers, clubs, etc. can be seen at every place. These are only made for the entertainment and comfort of the human being. Secondly, we will talk about the "modernization" that is entering in our society with a great speed; then again I will say that this modernization is not bad at all for our society. Today, in this era of development, the whole country is on a wave of modernization that is a good symbol because from my opinion, modernization is the symbol which shows the development of a society. Now let⊠s see a brief discussion about modernization, it is emerged in the late nineteenth century and was especially popular among the scholars in the mid of twentieth century. Modernization refers to a model of an evolutionary transition from a „premodern⊠ or „traditional⊠ to a „modern society⊠. Many great historians link modernization to the processes of urbanization and industrialization, as well as to the spread of education. As Kendall notes, "urbanization accompanied modernization and the rapid process of industrialization". Insociological critical theory modernization is linked to an overarching process of rationalization. According to the theories of modernization, each society can develop from traditionalism to modernity, and that those that make this transition follow similar paths. More modern states are wealthier and more powerful and their citizens are freer, with a higher standard of living. The former view is commonly projected by the politicians and the media and suggests that it is development, such as new data technology or need to update traditional methods, which make modernization necessary or preferable. Maintaining tradition for

tradition's sake was thought to be harmful for the developments and progress. The picture below shows that how the tradition is going to mix up with that of modernization

On the other hand this modernization theory has been criticized also by many pr ponents of modernization, mainly because it conflated modernization with westernization. In this model the modernization of a society required the destruction of the i digenous culture and its replacement by a more westernized one. Some proponents typically view only western society as being truly modern arguing that others are primitive or un evolved by comparison. This view sees un modernized societies as inferior even if they have the same standard of living as western societies. Opponents of this view argue that modernity is independent of culture and can be adapted to any society. Japan is cited as an example by both sides. Some see it as proof that a thoroughly modern way of life can exist in a non-western society. Others argue that Japan has become distinctly more western as a result of its modernization. In addition, this view is accused of being Eurocentric, as modernization began in Europe with the industrial revolution, the French Revolution and the Revolutions of 1848, and has long been regarded as reaching its most advanced stage in Europe (by Europeans), and in Europe overseas (USA, Canada, Australia, New Zealand etc.). Anthropologists typically make their criticism one step further generalized and say that this view is ethnocentric, not being specific to Europe, but Western culture in general.

After talking about all the aspects of modernization, finally we can conclude that modernization has been proved as a bless for every human being, for our society, as well as for urbanization also. Next, talking about the cell phone towers, then everybody knows that how much important role they are playing in our lives. As we have already discussed that cell phones are like basic necessity of our lives in the present arena, basically used for the purpose of communication. These cell phones can only be operated by these towers which can normally be seen in any locality. So now, we can think that how much important are these for us. When these cell phone towers are so important for us, they are solving so many problems of ours, use full in so many purposes also, can't we neglect some of the disadvantages of them which are of course negligible! According to me, we can neglect them easily as they are so much important for us. Similarly, talking about the hoardings, electric wire poles, elevated metro trains, these are so much important for us. They are contributing a lot in daily needs of our life. Without all these things we can't even imagine the present arena. So again I will say that if they have so much of advantages and so much of importance in our lives, then we can easily neglect there some of the disadvantages. Now, if we talk about some of the disadvantages, then I agree that these cell phone towers produces some harmful radiations which are not good for health, these atrociously huge and carelessly put up hoardings are not good for nature, these high tension electric wires are not good as they have magnetic field around them which affects the human beings a lot, these elevated metro trains which makes all the society crowdie and much more.

But after seeing all these disadvantages we can conclude that these defects can be nullified by some efforts. If the persons who are in a position to make a difference such as government personnel&s, architects, urban planners etc. will do some thoughtful efforts by taking these matters officially to the authorities that sanction such type of projects, then these are not very big problems to solve. The main thing we have to understand is that this will be possible only if some of the efforts will be done.

such type of projects, then these are not very big problems to solve. The main thing we have to understand is that this will be possible only if some of the efforts will be done, as a great poet "William Shakespeare" has said that

"Our bodies are our gardens to which our wills are gardeners"

And all this can be achieved if we continuously and slowly do some efforts and I am damned sure that a positive result will be the output because it is said that, "Many a little makes a mickel". So, according to me, all these thing we have discussed above, which are the major part of urbanization, are not responsible for the ugly environment. Now talking in the reference of architects, town planners, urban planners, we can say that they are the persons who design our society according to the needs and comforts of a human being. So these persons play a very important role in urbanization. They can would the society according to them. They can finish all the demerits of all the things discussed above by their designs if they want to do so. By their designs they can maintain the aesthetical values of a city, cultural ethos of a city and also traditions of a city. They can change our cities and can make them fully different. This target can be achieved slowly by regular efforts because a famous proverb says that "Rome was not built in a day".

Now, the question arises that what exactly is the thing that is making our urban environment ugly?? If we talk from the beginning, since past times when the urbanization was started, man tried his best to make everything comfortable and luxurious according to his needs without wanting any demerit of them to occur. But as it is clear that "every coin has two faces". He later on realized that the development he is doing has disadvantages too. Instead of focusing on these disadvantages, he continuously used to develop at a crazy pace. Now, if we take a example of any industry. In the beginning that industry is established for the production purpose and also to give employment to the public; but they never thought the negative aspects of that industry that how much harmful that industry can be for the human and nature. Now days, that industry is the major cause of pollution of air, water, noise and land etc. which is the major cause of making urban things ugly. Now, let&s take another example of a metro train, which is playing an important role in urbanization. In the starting, it is established to decrease the crowd on roads and to reach the destiny in less time and in fewer prices. They are doing their jobs in a very effective manner but there are some demerits also of these metro trains such as elevated metro trains are becoming obstacle in the crowdie areas increasing the compactness of a city. And the major harm the metro is doing is, during their construction accidents are very common. With the gap of one or two weeks, accidents took place regularly causing the loss to man and property. So the ugliness which is present in our urban environment is due to man made things only not by anything else.

At last, concluding that nothing is ugly and beautiful in this urban environment. Only the thing is that how the observer observes the thing. And also we have to do many effective efforts to bring the train on the track. "William Shakespeare" has said that

"We know what we are, but not what we may be"

A WORLD IN SEPIA MODE: HAMPI

If you ever thought that comparing anything ineffectual to a stone is justified, then you must visit Hampi. It is a place that makes you wonder how a monolith can transcend you to a different time, how boulders can change your perception of beauty and peace and how religion can carve its way through rugged scenery. Hampi boasts of a past that has lived one of the most majestic empires in India history: the Vijyanagara Empire. Remember Raja Krishnadev Rai or Tenaliraman? Yes, that one.

Approachable through a small town called Hospet in northern Karnataka, Hampi is a place full of ancient ruins of temples and palaces that have the typical Dravidian architecture.But what attracts me to Hampi isn't its rich past or religious significance. It is the tone and mood of the entire place, physically speaking. The town is a monochromatic painting in sepia mode, or so I feel. The yellow, beige and brown in sharp contrast with the green vegetation and blue sky are all you find in Hampi in the name of hues. And that creates the mood.

Apart from the temples and the ruins one can also get a shopping experience at the Hampi bazaar. The place houses some of the best food joints in the town and has a plethora of guest house options. The Virupaksha Temple near the bazaar is the only live temple which has the daily aarti during the mornings and the evenings. All the other temples are heritage sites.

The best place in the town is The Mango Tree. It is a small restaurant on the banks of the Tungabhadra River with the ruins of the Vijyanagara Empire beyond the same. A rainy evening, a mug of hot chocolate, the pink sky, and a sketch pad or a novel is all you need to complete the picture of one of your favorite traveling fantasies.

Hampi is a painter's paradise, a photographer's destination and a writer's inspiration. It is a place to go before you draw conclusion on what man has done to nature after all these millennia. The monolithic pavilions blending with the boulders, the heavily carved temple facades juxtaposed with the natural beauty of Tungabhadra River are enough to make you feel proud of belonging to a civilization that has lived for some architecture so desperately.

A trip in monsoons to Hampi is all you need to recover from almost every pain and heartbreak. The sturdy structures that have withstood the ravages of centuries infuse you with the spirit to stand up again, and this time more happily and gloriously.

THE CITY OF FAITH

I never thought that a city could hold a greater power over my beliefs than my own mother. My mother spent the past decade convincing me that god exists and one must have faith. I discovered it in Banaras. She brought me here for the first time. The city annoyed me immensely when I first arrived. No, it was not the bad traffic or the chaos. A life in UP has taught me to deal with all that. What vexed me was the fact that my belief in the non-existence of god was shaken. That is some realization.

When you're surrounded by thousands of devotees that believe in a god, they surely release some energy. Or that is how I support it in the conventional scientific mode. I did not do anything in the name of atheism. But there are millions thronging a dilapidated town to prove THEIR faith and religion. I was stupefied. The god isn't in the linga or in the waters of Ganga. It was in the heart of the people that throng the city of Banaras. It had a domain called faith. And when a million people pray with some faith, their prayers get answered. Not instantly, but I feel that they drive a force from within to chase their destinies. And this how the process of "dharma parivartan" gets completed! Or so it happened with me.

The ancient town has a mystic appeal. The deeper you get into its chasms or the "galis", the more you realise how mad the mankind has been for a god. I don't find it weak or redundant. I find it strong and fascinating and also very

justified that people live for a religion. They have embraced life and death more reasonably than any other people I've known. The age of the town only entrenches their faith system.

I think a city that changes its face with time is living according to its people. And that isn't bad. But it requires a mighty city that controls its people to suit its image. Banaras amazes you with its dynamics. It is flourishing, and evolving and yet it holds an image of a place that loudly speaks for the eras it has lived through!

coverpage of architectural document by authors about their architectural journey during trainning in ahmedabad

Prolog

An array of experiences of **architectural legacies** deep rooted in the historic traditions, From vernacular to the contemporary realities via modern routes.

Ahmedabad witnesses buildings from different eras to coexist together owing to the adaptive assimilation and also adaptive transformations by indulging in the use of age old regional elements in the modern vocabulary.The Architecture has remained a blend /fusion of deep rooted traditional values with the aspirations of changed times. Ahmedabad embraces a range of assets, ranging from a plethora of step-wells, temples, palaces, mosques, mausoleums and other buildings of religious significance to the eloquent works of the international maestros: **Le corbusier** , **Louis I kahn** to the contemporary modernist architects who pays a lot homage to Indian context including B.V.Doshi, Charles Chorea , A.P. Kanvinde, Anant Raje .Also projects by architects like Yatin Pandya, Nimish Patel, Gurjeet singh Matharoo, bimal Patel etc.who are constantly working for the welfare of the city.

The sense of association comes from the vernacular houseforms of Ahmedabad. known as **'pols'** characterised by medieval labyrinthine streets.

During the colonial rule, combination of the local with the foreign blossomed with British architect Claude Bately's architecture of the Electricity company office, M. J. Library or the Town Hall.

The zeal for progress brought home the best of international architecture in the post independence era. The French maestro - Le Corbusier designed institutions(Sanskarkendra,Mill owner's association), office building as well as private residences(Sarabhai house(1955 AD),Shodhan villa(1956 AD)).

Ahmedabad has proved to be a fertile ground for creative ideas to germinate and nurture.

Bricks of Ahmedabad caught the fancy of Louis Kahn, an american architect,who composed unique architectural poetry in brick and mortar at the Indian Institute of Management (1962 AD),giving the institutional campus its dignity and monumentality.

Ahmedabad narrowly missed on its canvas the signature of another architectural legend, Frank Lloyd Wright due to circumstantial changes. While the hue of Buck Minster Fuller's wizardry was witnessed by the geodesic dome at Calico Mill's Shop.

The architectural leagend of constant upgradation and experimentation lives on in the works of contemporary Indian masters.Balkrishna Doshi. His quest for Indian ethos and contextual idiom found answers at Sangath - his studio (1980 AD). And Gandhi Labour Institute (1981 AD) in the same spirit.

Indian Institute of management, Ahmedabad

Ahmedabad textile millowner's building

Achyut Kanvinde who popularised modernism in the local context with *ATIRA*, Physical Research Laboratory.
Gandhi Smarak Sangrahalya of Charles Correa (1964 AD) recasts the simplicity of vernacular into modern.
St. Xavier's School by Hasmukh Patel, a checkerboard plan with interspersed courtyards and corridors create an interactive learning environment.
After Kahn's demise, Anant Raje gave shape to Kahn's vision at IIM campus and further consolidated his architectural grammar in newer campuses like Mudra Instiute of Communication .
The search for contextual relevance and adaptation over changing times have become the preoccupation of architects of contemporary genre.
Nimish Patel and Parul Zaveri's pursuit of decoding traditional wisdom to improve the quality of the built environment resulted in a novel resolution at the Torrent Laboratories.
The Present generation reflect on distant as well as recent history . Entrepreneurship Development Institute by Bimal Patel (1992 AD) and Ahmedabad Management Institute (1999 AD) in exposed concrete recalls modernism.
A modern contemporary house by urbanist Rahul Mehrotra in the orchard contextual and traditional built forms as Serene spaces for social welfare as in ESI(environmental sanitation Institute) and Manav Sadhna activity centre by architect Yatin Pandya.
Apart from the built in the Vibrant city of Gujrat,the social scenario,interaction spaces,streets and squares,markets and eateries ,fairs and festivals and the Ecstasy of a place such as Ahmedabad gets expounded. Places with acute historic significane like Champaner,Pavagarh,jambugoda, ,Junagarh, baroda.Place of religious importance like Somnath,Veraval, Palitana.Places as tourists pradise like Kutch with its varies villages,each unique in regards to occupation(folk art) and Friendly folks.and also place rich in technological advancement such as Gandhinagar gets unfolded,conceptualized and featured in the **memoir**.

A place in peace and bliss,surrounded by the blanket of prosperity and the glimpses of oneness .A place in silence and activity at the same time,where the air is magical and full of aroma.

Where thoughts found meaning , ideas found way....A home away from Home...

Nrityagram
An ode to Dance

Amidst the cities trying to accommodate more and more number of schools and colleges due to the ever increasing competition for a glorious future, Nrityagram stands out ,tall and proud , away from the chaotic scenario. Built on the principles of "Gurukul" by the famous architect 'Gerard D Cunha' under the guidance of its founder 'Late Protima Bedi', Nrityagram " is a community of dancers in a forsaken place amidst nature. A place where nothing exists, except dance. A place where you breathe, eat, sleep, dream, talk, imagine - dance. A place where all the five senses can be refined to perfection. "

Built in the wilderness of a small village called 'Hessargatta', Nrityagram seems to have risen from the Earth itself as its extention towards the sky.The structures which mainly built of huge blocks of stones symbolizes the immortal soul of an ardent dancer which remains frozen in time. Consisting of several small blocks which are scattered around randomly like small pieces of Earth itself, it has a central spine running through it which flows organically through , linking it to each other in its due course .The spine is marked by several interesting sculptures and artifacts like terracotta tiles and pots along its sides which forces one to walk through it by generating a curiosity as to what it beholds at its end.

The entrance of the Nrityagram is marked by a temple dedicated to space flowing to a 'Yoga Centre' which is open to sky and is used for in house performances under the sky.The spine further flows into the offices and service blocks and then towards the Gurukuls which are marked by courtyards and thatched roofs. Mortar less stone filled archways which lie suspended in space are the prime features of the Gurukuls which brings out the purity of materials through its form and assemblance .A cluster of round structure,inspired by the Yurts of Tibet and Ladakh lie next to this. These are used as accommodations to the guests who come for workshops etc. It comprises of dancers, musicians, writers, theatre persons etc from all around the world. The spine then leads to the single storeyed house of 'Gerard D Cunha' which extends into an elegant patio at its entrance.The spine ends into the magnificent amphitheatre built with red Earth and along the lines of the Roman Architecture. Perfection in dance comes right next to being perfect as a human being for a disciple of Nrityagram. Hence the amphitheatre demands a very high order of prominence and respect from the residents of Nrityagram.

The campus of Nrityagram houses several beautiful gardens where vegetables, fruits etc. are grown by the students themselves.Since the education system is based on the typical 'Guru-Shishya' traditions, the students cook, clean and look after their Gurus and the campus in exchange to the knowledge imparted to them . Thus reviving the old Indian traditions with a modern approach and an agenda to promote Classical Dance and its forms , Nrityagram focuses on setting the spirits free through dance yet remaining rooted to one's traditions and values.It preaches dance not just as a mere art but as a way of living, a deep rooted faith which is nurtured by one's own spirits.

ArcOwiZ

Where the mind is without fear & the head is held high;
Where knowledge is free;
Where the world is not been broken up into fragments by narrow domestic walls;
Where the words come out from the depth of truth;
Where tireless striving stretches its arms towards perfection;
Where the clear stream of reason has not lost its way into the dreary desert sand of dead habits;
Where the mind is led forward by thee into ever widening thought and action;
Into that heaven of freedom, my Father, let my Country awake....

The surveys say 40%- 50% of Indian Population is Youth, the minds in the superlative stage of skill saturation. The quality of education of Indian Advanced Syllabi is nowhere a point of contradiction throughout the world. From intermediates to respective Senior Secondary's, the strata of education derives a creamy layer of extra ordinary & well sown minds to perceive the advancement in the Technical Genre of education. The methods of selection to exposure to the way of learning ensure it's fullest to provide few contributing minds to the development of the Nation and National economy. The economy doesn't only depend on the deeds of these minds but clearly stand out in the race of development of the Nation worldwide. The 'American' & 'Kingdom' factors are but the result of these technical minds throughout the World. It is nowhere hidden that the 'Standout' factor of any country depends on the amalgamation of "Technical & Infrastructure aspects". India, where the recession was nearly beaten off through ever running working minds is but an example of the fact.
The introduction of IIS's, IIT's, NIT's, State Government Universities and Colleges was a direction towards the refinement of budding sprouts.

The common style of placements and job cells serves the function of providing them one. But, with due increase in competition, increase in number of colleges, development of metropolitans, a sect of students is suffering, thus, striving in their own way. The exposure to bench remains in mist and reach becomes hurdled due to few unavoidable reasons. The employee to job ratio is unstable and if maintained, the employee fails to reach the job due to lack in exposure.

Arcowiz is a formulation of a stage, a ramp facing the screen of exposure at a common ground. It is an afterthought for letting the colleges to strive at a common level for in numerous opportunities to thrive in presence of leading market companies. A common ground to explore, exhibit, excel and achieve. It is a sustainable planning for students to prove themselves. Not only on the account of the students but also for the market to see and believe the results of such. The involvement of leading firms, architects and experts will make the programme a boon. It is a trial to break the film of hesitation of minds in front of market at college level and to stand and thrive for one self.

The programme includes the number of competitions, lectures & workshops by the eminent, exhibitions, presentations & discussion sessions. It is tried to incorporate the psycho- technical planning in best contributing way. The opportunity for each college to float the competition is proposed so as to maintain an unprejudiced stage of excellence and thus the juries will be eminent from field themselves.
With participation of students from different colleges, Arcowiz should prove to be success and a revolution. Let's plan and act together.

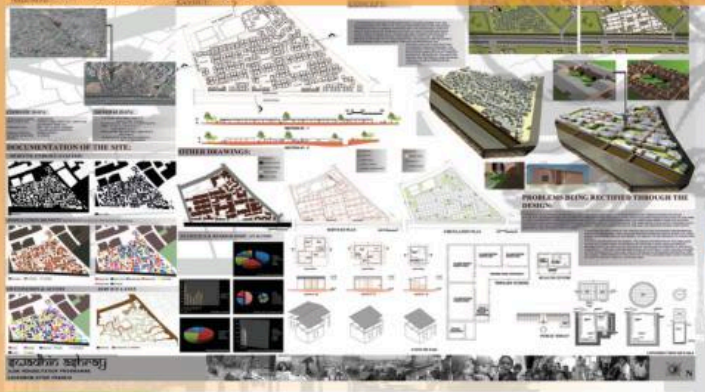

A very first successful attempt of team Arcowiz was to formulate the combined event with the I.E.T., Lucknow under the name of Frugal Architecture & Engineering. Both the institute participated with zeal and vigour at a common platform making the outcome worth shining.

This new typology of convention is a great platform for both the engg. & architectural field to intract at a same point.
